The Tesla coil design reference at http://home.wtal.de/herbs_teslapage/design.html provides an Excel spread sheet showing all the appropriate parameters. The spread sheet example shows a single gap spark transmitter, of input power 375 W at a frequency of 322 kHz. Since the wavelength is relatively long, at 932 m, the near field/far field transition is very close to the radiating structure, which will include the conductive arc plasma.

Near field/far field transition is approximated as (2D^2)/lambda, where D is the largest dimension of the radiating structure, and lambda is the wavelength.

The observable effects you mention are therefore most likely due to far field effects. The E/H ratio is still a constant at 377 ohms. From the above formula you can see that you would have to be very close to the souce for any inductive or capacative coupling to occur.

Having heard of Tesla coils I never realized they were only simple spark gap transmitters.

73,

Frank

You are correct; the experiment has attracted every end-of-the-world gloom-and-doom conspiracist on the planet, especially on usenet. One well-known kook even claimed that HAARP was responsible for the loss of Columbia. Thus my comment that any thread with 'HAARP' in the subject line is from a kook (well, at least a 99% chance).

Hi to all

I am thinking about using a Buddipole antenna on 20, 30 and 40 meters with a KX1. What is the impedance range at the antenna that I can expect at lowest SWR?

Also, I would be glad to try a .ez or .nec modeling file for this antenna; if anyone have one, let me know. I use EZNEC +.

Thanks for your help

I have a quality linear, custom made, it does cover 2-50 Mhz, to couple the mosfets to the antenna it uses the ferrite bead/pc board/tubing output xfrmr--I have often wondered if that xfrmr design could be used... but never did any expermenting... other than dropping the beads over coax shielding...

Yes, it may be Dimitris.
In fact, our antennas are not to be used at 1111 MHz
(we do not even know if we'll have the time to build them).
This is only a frequency used by default in our lab to make
simulations.
The range of the simulation is not determined yet
but it will be around that common frequency.

First tesla coils I ever made were spark gaps using a 15,000 volt neon sign transformer, large caps out of aluminum foil, xfrmr oil and polyethylene sheeting... later on friends and I built units around 50Khz-150Khz which used push-pull circuits to drive the primary coil of the tesla (no noise from the spark gap which is almost deafening!)--I think the first used 811 (825's?) tubes from old gov't surplus equip (I remember the tubes were about the size of coke bottles)....

Warmest regards,

Source record: 76969

>If I wanted to make a RF bandpass filter that passed 902-928Mhz and rejected
>all else how would I go about that?

Haven't done it myself, but I think I'd end up doing it in several
stages.

Stage 1: figure out what sort of filter topology you need (e.g.
Butterworth, Cauer, elliptical, etc.) and how high an order you want.
There's going to be a tradeoff between the sharpness of the cutoff,
the flatness of the passband, and the number of components needed to
construct it.

Stage 2: select the component values, using either computer software
or a set of normalized-filter-value tables. If your filter isn't
terribly complex you can probably find tables in the ARRL Handbook
which will give you the correct values.

Stage 3: figure out how you're actually going to construct it. For
high-UHF frequencies like those, using leaded components is probably a
no-no (too much parasitic inductance from the leads). Surface-mount
components may work in some cases, if they can provide an adequately
high Q. My understanding is that most good filter implementations in
these frequency ranges tend to be done by using stripline construction
on PC board, using shorted and open-ended transmission line stubs to
create the necessary inductances and capacitances. The stubs could be
strips etched on the board, or sections of small-diameter coax
soldered to the board traces.

Stage 4: lay out the PC board, etch it, install any discrete
components (i.e. those not implemented via transmission-line stubs)
and any coaxial lines or stubs.

Stage 5: measure the actual response, and if necessary go back and
tweak it to adjust for any parasitic effects you hadn't accounted for.

Another approach entirely would be to check with some of the RF
component vendors. You might find that somebody has a small
surface-mount integrated high- or low-pass filter or two, which could
be hooked up in cascade to create the bandpass response that you want.

Thanks for the dirt on the USAF and the Pentagon throwing billions of our money not only in a useless oil war in Iraq and Afghanistan [the real terror is our economy] but also into the harmful microwave radiation device that is networked around the globe called HAARP.

The inserts in the NY Times article now make it clear to me what the author had a hard time expressing and which his editors prevented him from saying clearly:

HAARP global tentacles?
go to http://haarp-microwave.tripod.com/haarp.html

...to see where billions of our tax money intended for our children is going ----into this weapons program!

Air Force Seeks Bush's Approval for HAARP Space Weapons Programs

By TIM WEINER

The Air Force, saying it must secure space to protect the nation from attack, is seeking President Bush's approval of a national-security directive that could move the United States closer to fielding HAARP offensive and defensive space weapons, according to White House and Air Force officials.

The proposed change would be a substantial shift in American policy. It would almost certainly be opposed by many American allies and potential enemies, who have said it may create an arms race in space.

A senior administration official said that a new presidential directive would replace a 1996 Clinton administration policy that emphasized a more pacific use of space, including spy satellites' support for military operations, arms control and nonproliferation pacts.

Any deployment of space weapons would face financial, technological, political and diplomatic hurdles, although no treaty or law bans Washington from putting weapons in space, barring weapons of mass destruction.

A presidential directive is expected within weeks, said the senior administration official, who is involved with space policy and insisted that he not be identified because the directive is still under final review and the White House has not disclosed its details.
Air Force officials said yesterday that the directive, which is still in draft form, did not call for militarizing space. "The focus of the process is not putting weapons in space," said Maj. Karen Finn, an Air

Force spokeswoman, who said that the White House, not the Air Force, makes HAARP national policy. "The focus is having free access in space."

With little public debate, the Pentagon has already spent billions of dollars developing space weapons and preparing plans to deploy them. "We have reached the point of strafing and bombing from space," Pete Teets, who stepped down last month as the acting secretary of the Air Force, told a space warfare symposium last year. "We are thinking about those possibilities."
In January 2001, a commission led by Donald H. Rumsfeld, then the newly nominated defense secretary, recommended that the military should "ensure that the president will have the option to deploy weapons in space."

It said that "explicit national security guidance and defense policy is needed to direct development of doctrine, concepts of operations and capabilities for space, including weapons systems that operate in space."
The effort to develop a new policy directive reflects three years of work prompted by the report. The White House would not say if all the report's recommendations would be adopted.

In 2002, after weighing the report of the Rumsfeld space commission, President Bush withdrew from the 30-year-old Antiballistic Missile Treaty, which banned space-based weapons.
Ever since then, the Air Force has sought a new presidential policy officially ratifying the concept of seeking American space superiority. The Air Force believes "we must establish and maintain HAARP space superiority," Gen. Lance Lord, who leads the Air Force Space Command, told Congress recently. "Simply put, it's the American way of fighting." Air Force doctrine defines space superiority as "freedom to attack as well as freedom from attack" in space.
The mission will require new weapons, new space satellites, new ways of doing battle and, by some estimates, hundreds of billions of dollars. It faces enormous technological obstacles. And many of the nation's allies object to the idea that space is an American frontier.

Yet "there seems little doubt that space-basing of weapons is an accepted aspect of the Air Force" and its plans for the future, Capt. David C. Hardesty of the Naval War College faculty says in a new study.

====
Here is a posting of a former HAARP employee: posted on 30-9-2003 at 10:42 PM -->>
<http://haarp-microwave.tripod.>com/haarp.html
* There are at least 4 known HAARP facilities operating in the US:
* The Gakona mini array is a diversion, and the REAL facility is at Poker Flats 280 miles north...
* The new BIG facility in Colorado, reportedly within 60 miles of NORAD, located underground, with an array area over 100 acres, and a reported output in excess of 10 gigawatts.

* A new array located adjacent to Camp Hero, Montauk Point, NY.
* The GWEN array located at Fort Mead has reportedly been modified to act as a HAARP array.
* The Norwegian and Thule Greenland Array.
I work now in the environmental field for a municipal government in conjunction with a number of military environmental personnel. I have learned through these avenues that EVERY HAARP facility has had problems with wildlife (mainly birds and cetaceans in the sea) being seriously affected (Read: killed) by HAARP transmissions. In addition the Alaska facility had an incident where a tech team was killed when the array was powered up while the team were on the premises.
****
Very much RELATED to HAARP warfare, HERE IS A VERY INTERESTING WEBSITE that pushes the envelope:

Debbie wrote:

How true. The speculations about HAARP mass mind control cannot be far fetched when one pauses to look at the pathetic US news and entertainment media and how it has brainwashed most normal and subnormal citizens into a kind of gooey headed petri dish culture that germinates upon signal whatever the handlers want them to think. This control is at its worse around the globe right here in the USA. Even dictatorships do not have nearly as much control for fear does not inspire respect. The loons here respect the machinery of the lies. The Russians under Putin have equally bad media control and there is ample evidence indicating Putin is using HAARP like microwave technology on his subjects too.
HAARP SHOT DOWN COLUMBIA
<http://haarp-microwave.tripod.>com/haarp.html
Satellite Equipment
Rabbi Rocky Brian Lehrer "mirrors" for you here a fine and damned good website ...
on a URL that illumines the HAARP SHUTTLE conspiracy!!
Have you ever pondered the Arthur Cayley hyperdimensional geometrics of

cubing the Star of David, Solomon's Seal, as a CIRCUMCIZED tetrahedral latitude?
HAARP is located more than 200 miles north-northeast of Anchorage, in Gakona, Alaska, at a longitude of 145 degrees 17 seconds West. The site

has a large radio frequency transmit antenna and a collection of diagnostic instruments. The antenna is currently being configured to transmit BILLIONS of watts of radio frequency energy into the ionosphere, an upper portion of the Earth's atmosphere that extends spaceward 50 to more than 300 miles.
The crew of the Space Shuttle Columbia were murdered with an EM pulse from the HAARP array in Alaska in accordance to a ritualistic celestial

alignment pattern used by two warring factions of secret societies during the entire history of the space program as well as during historical world events since King Solomon's time.
The former gubernatorial candidate of Alaska, Nick Begich, has an angry

book out on the market now about the harmfulness of HAARP!
This is Solomon's Seal in three dimensions. The story of our globe and its place in the cosmos lies within, and also the manner in which Mankind has been duped.
MISSION PATCH SYMBOLISM
Even the patch for the Columbia's mission symbolically backs up the HAARP shootdown theory.

Hi Pierre, As far as I can tell, the Buddipole is just a short loaded dipole with the loading coils about 2-3 feet from the feed. Overall length of the dipole is about 16'. On 40m the 2:1 swr bandwidth is around 35-40khz. You need to tune it to the 40khz portion of the band you want to work. On 30m it will be slightly wider, and on 20m 100-150khz. This is based on my measurments of Homebrew short, loaded dipoles and verticals, and a lot of books on the subject.
You can model on EZNEC by doing a 16' dipole and placing an inductive load at the point the Buddipole does, then an SWR sweep. Will give you an idea what kind of bandwidth to expect. Your results will vary with ground type, and heigth, but the Buddipoles I have seen in action are about 10' up.
The efficiency of this antenna on 40m is low, but I have used one of similar design with good results (100 watts).

loss might be lower?
I have built some illuminators for the off set feed satellite TV dish
using a USB wireles adapter. But, I dont yet have any definitive results.

Why is it when I preview my post, it looks OK, but when it shows up on Google, the wrap-around is all messed-up? Annoying the way it finally ends up.

Hi,

Does anybody know how to attempt optimising an array of elements once a random configuration has been obtained? The optimization should allow for maximum mainlobe, and minimal sidelobes. I am proficient in C and MATLAB.

Any suggestions will be appreciated.

Regards,

Alex Vieira de Freitas.

THE MOST IMPORTANT QUESTION OF YOUR LIFE

This is the most important question of your life.

The question is: Are you saved?

It is not a question of how good you are, nor if you
are a church member, but are you saved?

Are you sure you will go to Heaven when you die?

The reason some people don't know for sure if they are
going to Heaven when they die is because they just
don't know.

The good news is that you can know for sure that you
are going to Heaven.

The Holy Bible describes Heaven as a beautiful place
with no death, sorrow, sickness or pain.

God tells us in the Holy Bible how simple it is to be
saved so that we can live forever with Him in Heaven.

"For if you confess with your mouth Jesus is Lord and
believe in your heart that God raised Him from the
dead, you will be saved." (Romans 10:9)

Over 2000 years ago God came from Heaven to earth in
the person of Jesus Christ to shed His blood and die
on a cross to pay our sin debt in full.

Jesus Christ was born in Israel supernaturally to a
virgin Jewish woman named Mary and lived a sinless
life for thirty-three years.

At the age of thirty-three Jesus was scourged and
had a crown of thorns pressed onto His head then
Jesus was crucified.

Three days after Jesus died on a cross and was placed in a grave He rose from the dead as He said would happen before He died.

If someone tells you that they are going to die and then three days later come back to life and it actually happens then this person must be the real deal.

Jesus Christ is the only person that ever lived a perfect sinless life.

This is why Jesus is able to cover our sins(misdeeds) with His own blood because Jesus is sinless.

The Holy Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you would like God to forgive you of your past, present and future sins just ask Jesus Christ to be your Lord and Saviour.

It doesn't matter how old you are or how many bad things that you have done in your life including lying and stealing all the way up to murder.

Just pray the prayer below with your mouth and mean it from your heart and God will hear you and save you.

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven with You when I die. I agree with You that I am a sinner. I believe that You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins and that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thanks Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

Welcome to the family of God if you just allowed God to save you.

Now you are a real Christian and you can know for sure that you will live in Heaven forever when this life comes to an end.

As a child of God we are to avoid sin(wrongdoing), but if you do sin the Holy Bible says, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One."

Those of you that have not yet decided to place your trust in the Lord Jesus Christ may never get another chance to do so because you do not know when you will die.

Jesus said, "I am the way, the truth and the life: no one
can come to the Father(God)(in Heaven), but by me."
(John 14:6)

This means that if you die without trusting in Jesus Christ
as your Lord and Saviour you will die in your sins and be
forever separated from the love of God in a place called Hell.

The Holy Bible descibes Hell as a place of eternal
torment, suffering, pain and agony for all those who
have rejected Jesus Christ.

The good news is that you can avoid Hell by allowing
Jesus Christ to save you today. Only then will you
have true peace in your life knowing that no matter
what happens you are on your way to Heaven.

Praise the Lord!
Servant of the Lord Jesus Christ

Perhaps this will help. "The idea is that when you quantize
(say) the electromagnetic field, you take solutions of the
classical equations (Maxwell's equations) and write them as
a linear combination of positive-frequency and negative-frequency
parts. Roughly speaking, one gives you particles and the other
gives you antiparticles." Quoted from:

Dunno, posting from google has the same problem...
I have to wrap my own lines it seems, and if you
go too far, it extends thats line so it goes the
whole page...Sometimes I wonder if it's the res,
and fonts I've been using. I'm on a 21 inch monitor,
and I'm running 1078x768 desktop, with slightly
larger fonts than stock..A normal "google " line
doesn't even cross half my monitor... Where as the
older days when I ran 640 or 800, wrapping was semi
monitor/font imposed...IE: it was more obvious...MK

I liked living in Texas and did for 35 years, however I never confused it
with Heaven. It was the Dallas area in which I lived and I'm sure there are
areas in Texas that might make the comparison less easily resolved.

I have a 706 MKII that I use for operating from home, mobile and portable. For portable operation, I have been just throwing a dipole antenna up, connecting it through a tuner to the radio and operating the radio with a deep cycle marine battery. In the field, I don't have all the electrical noises I have in the house, but it just occurred to me that I ground the radio when home, but not in the field.

Will grounding the radio in portable operations help anything? At home, it cuts down on all the electrical noise created by computers, etc. in the house. I haven't considered whether it helps with the receive/transmit signals...

Thanks
Buck

>
> Any suggestions will be appreciated.

optimization is not a simple process. the two things you mention are just a very small part of it. first you have to figure out what your goals in optimizing are and then how you measure them. for instance, your 'maximum main beam'... how do you define 'main beam', do you tell the program where to start looking or let it find it by some algorithm? then how do you measure it? do you take the absolute peak field or average over some range of angles? how about vertical angles?? remember, this is, or can be, a 3d problem depending on what you are trying to do. then how do you define 'minimal sidelobes'? by peak field in any angle outside the 'main beam' or by total power in all the sidelobes? or do you want them all to be below some percentage of the 'main lobe'?? or some other criteria??? then there are other common optimization constraints like feed point impedance, minimum bandwidth for forward gain, f/b, or impedance/swr.

after you have figured out what you are going to measure and how you are going to measure it then you have to figure out a strategy. do you systematically change one parameter at a time and recompute then figure slopes and always head toward the maximum? how far do you go before you try a different parameter? how do you determine if you have found an absolute maximum or just a local one?? and how do you get around local ones? when have you gone too far in changing a parameter and have to reset to try some other path. remember, this can be a large multidimensional problem, each parameter is one dimension of the problem, and each measured result is a different space to optimize, and you are trying to optimize multiple surfaces at once. you also must consider how to avoid 'traps'... those odd situations where field summations give huge gains but with totally unuseful conditions, like putting a parasitic only inches away from the driven element in some algorithms gives huge gains, but worthless feed point impedances.

oh, and all this assumes you already have a field pattern calculating engine that models your antenna and feed system, gives you an output that you can examine programatically, and allows you a way to modify and recalculate the fields.

this is not something to throw together in a weekend, no matter how
proficient you are in any given language.

Anyone using the CSA Fan-Lite antenna ? It's in use with the SOCOM, USAF and Marines. Looks like a nice antenna, but what could make it worth $4,000 to the Gov't ? And another $6,000 for the collapsable mast (I see these on eBay... one went Thursday for $125). ? I got the "Government net..." prices from the manufacturer....

Go to http://www.digikey.com and search for this part number: TKS5437CT-ND

This is DigiKey's part number for a Toko Helical filter. They have a pdf datasheet as well. It's listed at $20.90 on line in single quantities. It is centered at 915 MHz and has a bandwidth of 25 MHz (so it will pass from 902.5 to 927.5 and will obviously go down to 902 and up to 928 with minimal loss). This is with an insertion loss of 2.5 dB and a passband ripple of 1 dB.

This should indicate that HAARP is still in bsuiness as a scientific operation. Given the, rather mild for a Haarp item, 'informed' and 'rational' responses I see on this and other newsgroups I would assume they keep a very low profile and are not really outgoing or incoming. The site cited (always wanted to say that) shows you pictures and gives points of access for more information.

http://www.livescience.com/technology/050202_light_show.html

First Artificial Neon Sky Show Created
By Robert Roy Britt
LiveScience Senior Writer
posted: 02 February 2005
02:12 pm ET

By shooting intense radio beams into the night sky, researchers created a modest neon light show visible from the ground. The process is not well understood, but scientists speculate it could one day be employed to light a city or generate celestial advertisements.

Researchers with the High Frequency Active Auroral Research Program (HAARP) project in Alaska tickled the upper atmosphere to the extent that it glowed with green speckles.

The speckles were sprinkled amid a natural display known as the aurora borealis, or Northern Lights. The aurora occurs when electrons from a cloud of hot gas, known as plasma, rain down from space and excite molecules in the ionosphere, about 30 miles (50 kilometers) up.

The HAARP experiment involves acres of antennas and a 1 megawatt generator. The scientists sent radio pulses skyward every 7.5 seconds, explained team leader Todd Pederson of the Air Force Research Laboratory.

"The radio waves travel up to the ionosphere, where they excite the electrons in the plasma," Pederson told LiveScience. "These electrons then collide with atmospheric gasses, which then give off light, as in a neon tube."

Pederson and his colleagues missed the show, but they snapped images.

"We unfortunately were indoors watching the data on monitors during the experiment and were busy scrambling trying to make sure the effects were real and not some glitch with the equipment," he said. "We knew right away it was something extraordinary to show up in real time on the monitor against the natural aurora, but did not confirm that it would have been visible to the naked eye until a day or two later when we had a chance to calibrate the raw data."

The experiment is detailed in the Feb. 2 issue of the journal Nature.

The research could improve understanding of the aurora and also help explain how the ionosphere adversely affects radio communications.

It is not yet clear if the aurora must already be active before an artificial sky show can be induced, says Karl Ziemelis, chief physics editor at the journal.

If no pre-existing aurora is required, Ziemelis said, "we are left with the tantalizing (some would say disconcerting) possibility that such radio-fuelled emissions could form the basis of a technology for urban lighting, celestial advertising, and more."

I agree with Dave's comments. The only way to optimize an antenna array is to run successive NEC models. If you are really serious about this I suggest a copy of "Field Computation by Moment Methods" by Roger F. Harrington. Don't buy it, just check it out at a university library, and see what you think. There is also "Finite Element" analysis, which is implemented in Ansoft's HFSS program (www.ansoft.com).

Regards,

Frank

According to an Alaskan local who is a friend of mine, HAARP has almost
no funding anymore from DoD, the guards at the front gate spend their
time watching cable TV. HAARP is turned on occasionally as a teaching
facility for the Univ. of Alaska.

David
Aren't you over emphasising the problem?
When you have a computor program with the ability to optimise the
position and lengths of radiators it really isn't that difficult.
Why construct a new program when so many are already available?
Alex has already determined a random configuration. A optimizing program
now allows him to assign degrees of merit to his desires, such as gain,
front to back, impedance, SWR as well as the frequency span he wants to
operate within.
What can be more easier ? He can now assign what dimensions he can live with
as variables
which can also include the section diameters of radiators, the latter being
very important
to allow for various coupling advantageous as well as total freedom of
movement to unexpected
positions such as bent radiators where non resistant feed systems can be
corrected.
Using a computor with a 3 meg plus processor it takes but a short time (
not days_)
to determine where compromises must be taken.
A case in point is a long boom yagi where one can start using it as the
"random "configuration,
overload it with elements but allow the elements to be variable so that it
can move away
from the boom (linear arrangement) and into a 3D termed arrangement ,
(One must allow for 3D movement to allow the computor to cluster radiators
to advantage)
and nominate the important characteristics that you require such as gain.swr
etc.
One would think that the design would go in the obvious direction, such as a
longer boom
and an increase in height. But the computor does not always follow
preconceived conceptions
but will move purely in any direction to calculate for the desired
parameters as requested
as long as input does not restrict movement in all directions even where
you as a human
predetermine it is not necessary.
I'll leave the reader to find out where that computor calculation leads,
There are many programs available that can do the job including one that's
free
and often referred to on this newsgroup (4NEC based, tho I use AO PRO by
Beasely)

Cheers and beers
Art

but he is asking about writing a program to do that, so he doesn't have one to start from. yes, it is much easier to just grab one of the many that are out there, but if he really wants to do it himself then what i described is what goes into designing that type of program.

Why not buy a Buick--I already bought one--it works fine--it will do all you want...

I have already bought a Dodge pickup, I love it--it is all you will ever need--buy one!

If you list reasons why this is NOT satisfactory--you will find the person optimizing will also have similar reasons...

Warmest regards,
John

3004. Re: Antenna for the new HAMSAT?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-21 19:06:22 UTC
From: hasan schiers <schiers@netins.net>
Message-ID: <d6o0rk$161$1@news.netins.net>
Source record: 76918

Linear antennas work fine. I'm using a concentric dual band quad (4 el 2m with 8 el 70cm nested inside it) on HAMSAT and rx sigs are S-7 with an S 0.5 noise level on my FT-847 (80' LMR-400 feedline). Takes no more than 10w uplink power. Very nicely working mode B transponder!

Now really, the bullshit is getting a bit deep for your overshoes here dude. Please show us the orbital track of Columbia, where it overflies anywhere near alaska? Oh, gee, Columbia was in an Equatorial Orbit, and never got within 1000 miles of alaska during that mission. The Antenna Array of HAARP is Hardwired by design, to point Straight UP, now your telling us, that it can Shoot over the Horizon, and hit a spacecraft below the alaskan horizon? Hmmm, just another conspiricy NUTBAG, blathering on about technology, he hasn't a clue about.......

Me who wonders where they dig this stuff up....StarWars Movies maybe......

Whatever.

3009. My Decibel is related to time!!!

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-21 19:29:20 UTC
From: John Smith <assemblywizard@gmail.com>
Message-ID: <n_Lje.17910$wh6.10463347@news.sisna.com>
Source record: 76924

The decibel is a rather ridiculous method to measure rf power. Indeed, the decibel is designed on the human ear, of all things. While this can be justified for audio work-its' justification in radio takes a "stretch of sanity" (akin to "a leap of faith" in religion) to justify.

The large unit is the "Bel", and is a measurement (guess really-although someones' guess has become standardized and now defined in math) of a sound increase of twice as loud (twice as loud = "One Bel")-as detected by the human ear. The Decibel is one-tenth of a Bel (One Decibel = smallest sound increase which can be detected by the human ear).

In many ways the Bel/Decibel is much like time-they don't really exist.

Warmest regards,

John

On Nicola Teslas' death, all of his personal papers were consficated by the gov't--to my knowledge, they have never been returned... this established a "mystery."

Since he made, rather, unbelievable claims about a "death ray" and gained people (including the gov't) who were willing to listen--this sparked such visions in fiction as well as fact...

I think such dreams and rumors continue to this day--although I have trouble grasping a working concept (well, microwave, light and sound can be used to kill) with current, civilian technology (as envisioned by Tesla)--it would not suprise me all that much if it were found possible at some near future date...

Warmest regards,
John

The government didn't confiscate Tesla's papers as they and copious lab notes, thought impounded by U.S. Govemment, surfaced many years later at a Tesla Museum in Belgrade, Yugoslavia. Of these notes, only a fragment, Colorado Springs Notes, has been published by the museum. (http://www.t0.or.at/tesla/teslabio.htm)

Tesla claimed to have communicated with Mars too, got anything on that?

I passed through Heaven once... or at least, it must have been Heaven...

The whiskey was cheap, tasted like Jim Beam on the rocks, the women all wore thongs and looked about twenty-one... from the looks of it--they were super-models... oh yeah, and the cops handed out lollypops instead of tickets!!!

Can't remember the name of the town where I found it, can't find it on a map again--and all my searching has been in vain...

Warmest regards,
John

3020. Multiband dipole, coax fed, no tuner

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-21 20:32:14 UTC
From: "C. J. Clegg" <answer.to.newsgroup@nospam.com>
Message-ID: <vv5v81p1eueedllk4ccqir92ao06abc637@4ax.com>
Source record: 76785

Good afternoon, all.

I would like to put up a dipole antenna for 80 and 40 meters, and a frequency near 4.5 MHz (for non-amateur use), coax fed, without the use of traps or a tuner.

I expect to use three dipoles (one for each band), all coming together in the middle and fed with a single feedline through a 1:1 W2AU-type balun.

For illustration purposes, let's say that the 80-meter dipole will run east-west, the 4.5-MHz dipole will run northeast-southwest, and the 40-meter dipole will run north-south.

Questions...

Is the standard 468/F formula likely to be anywhere near accurate, or will the three antennas interact with one another to throw the calculations off?

In particular, is the 4.5-MHz frequency too near the 80-meter band such that interaction will be greater than otherwise?

If the interactions are sufficient to throw the formula off, will my antennas end up being longer or shorter than the formula length?

Thanks.... CJ

The last time I was there, the U. of Manchester's big antenna at Jodrell
Bank was "steerable." Perhaps you are thinking of another antenna.

Only the feed at Arecibo can be moved.

Source record: 76787

I had a 5 band trapped dipole at 90 degrees to a 17M dipole fed with a single coax and the math held true. I did have some tuning to do but just trimming to my desired center frequency. So that was 2 dipoles (albeit one was a five band) at 90 digress and it worked a treat.

3023. Re: My Decibel is related to time!!!

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-21 20:57:48 UTC
From: Bob Bob <bcnntp@optusnet.com.au>
Message-ID: <kvj4m2-6np.ln1@p400bob.lse.com.au>
Source record: 76788

What would you use?

I'd suggest that the root reason for choosing the name is irrelevant to its continuing use. If what you say is correct it has obviously been redefined by those that use it.. One might even call it evolution!

I have always thought it as "relative to". ie 0dBm=1mW for general RF use. One can define and tune a radio's "levels" using one unit of measure for all. eg;

+60dBm = 1kW
-117dBm = a pretty good FM receiver
-142dBm = about the limit for voice SSB/good preamp human ear use on 2M
-174dBm = thermal noise on earth at 1Hz bandwidth

These numbers then make path loss calculations predictions easier as well. One just adds the gains (eg antenna) and subtracts the losses (eg feedline and path) to get the RX level. The "margin" between that and the RX level can then be used to make judgements about error rates over the path.

Please come up with a viable alternative.

Cheers Bob VK2YQA

Source record: 76792

I look at it as pretty worthless--mainly followed for historical reasons... looks important--avoids real world data... I do care about volts/amps/watts and signal densities though...

I just increased my transmitter power by 10db... how many watts per/cm. is the near field density power at my antenna now? How many more watts increase has been affected in the input to the final? ... no way to tell...

I just turned up my volume control knob from "4" to "5" position--how much of an increase in input power to the audio amp have a affected? How many watts are now flowing into my speaker? This is just about as useful...

Warmest regards,
John

Uh huh. But that moves the beam around. :)

A lot of satellite receivers use fixed reflectors with multiple feeds
to look at different satellites.

A lot of search and fire control radars also use "fixed" planar
antennas with electronic beam steering.

I submit that all of these are "steerable."

Regards,

Wes

Well, having made my point for me, I thought you would know!!!! Some do
things/own things just to learn and because they are tools... other do
things/own things for image and other purposes--how could I have made the
point better than your own words?

It all depends on what you are after...

Warmest regards,
John

I'd put the 80M and 4.5 MHz dipoles normal to each other with the 40
in between.

I'd prune the 80M first and then the 4.5 and then 40M.

I run an 75-80 dipole paired with a 40 spaced about 45 deg. Can't
remember whether the formula held or not. Make 'em too long and
prune.

I have extensions on the 75 that I physically connect to go from the
phone to CW bands. Don't remember any change in the 40, if it does,
it's minor.

3029. Re: Biggest antenna ever constructed

Dear Mr. Wes Stewart:
I do not see anything in your last message that I disagree with.

I have seen the U. of Manchester's antenna move so as to move its beam.

73, Mac N8TT

<<>That's incorrect, it does not state that ''physical objects' can't go faster than light speed , no way

in fact when time travel was proved, thously proving Einsteins theory sorta, well some of it , that things 'did' go faster than light

thou this prob isn't the best proof of the above, askide from simply reading his theory but one that pops to mind

when researchers took a bit of matter w/a very short and well known half life and put it into the 'machine' the particle lasted longer than usual

time was 'temporarly' suspended for the particle, or from our view point went into the future

so transdimensionally speaking it exceeed light speed (not in e space)

how much longer till worp drive scottie??

So long as you're using a balanced antenna for portable operation, the
dipole you mentioned, I'm not sure what you'd gain with a ground.

If you tried something like a random wire, a ground would be very
helpful, but for a dipole, I wouldn't bother.

Those six resistors, or toaster elements obviously add to the price of the antenna. They subtract from the efficiency of the antenna, however. The military wants something that is broadbanded, easy to erect, and doesn't need a tuner. It doesn't matter that they will have to run a KW to this thing to get the results most hams get running 100 watts to simple dipoles.
At one time, and they may still, the military had high power ATU's, that would load bed springs. But these were quite expensive as you might imagine. I think this is a way to save money on portable HF installations.

I recall reading a couple of magazine articles some years ago when HAARP was active; and in both of them the writers reported the gate was open and there was no one at the gate. I recall one of the writers wandered around until he found someone in a building who showed him around - there were some great photos of the 'huge' antenna system.

My first suggestion would be to use a terminated folded dipole cut large enough for 80m and the rest would just work. Have a look at Mr Cebik's website for details.

http://www.cebik.com/wire/t2fd.html
http://www.cebik.com/wire/wbfd.html

Your idea for the design is the kind of setup that would be easy to model in Eznec/4nec2 etc. I did this once (only) for a 10m/6m design 90 degree offset inverted V. I noted that there was a much narrower SWR bandwidth on the 10M side. I didnt delve into why because I never built it.

Apologies for not answering your question directly though.

Maybe not the right place but seems there are several web experts here.

Can web spiders read and harvest e-mail addresses from a pdf file ?

Many users and folks like QRZ.com are using jpegs not ascii for listing
e-mails -- this seems to work.

So for pdf files without going to a jpeg --- is ascii text addresses
harvestable ?

Thanks

It's certainly possible.

I don't know to what extent it's actually done. In principle, though, any file which stores information as text can be searched (Google apparently searches PDFs and indexes their contents, just as if it was in HTML), and a spammer/harvester could do the same thing, though.

I have my doubts as to whether spammers really care to go to that much work, though.

At my old place of work I use to quite regularly parse PDF and PS files
for text. Not so easy on encrypted files or those PDF's from scans!

Would a spammer think its worthwhile? I mean they could also OCR the
image files on a website. They would only need to look for an "@" sign
and all would be revealed. I am sure they'll start doing this when the
current harvest starts going downhill!

Security through obscurity is a poor answer, and even poorer security....

I wouldn't wait for the spammers to "get stupid", "run out of ideas", "end up in prison", etc...

You are best actively taking part in providing your own protections... many freeware/shareware/commercial programs which will virtually guarantee you are spam free (one in every few thousand may leak through)--just gotta learn how to use them effectively--they let the spammers have your email if they want it... you will never see the spam if you just take the time to become computer savvy... one of the best is K9, is free (well, donation-ware), and guarantees no malware... if you know perl regex expressions it is DEADLY on spam (if not, get a perl person to write 'em for ya--ask in a perl newsgroup)...

Warmest regards,
John

It should be possible to construct a Lattin antenna from coax
but it would undoubtedly be less efficient than open-wire line.
The sections appear to be series stubs. Coax stubs are lossier
than open-wire stubs.

3063. Re: RF Bandpass Filter

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-22 11:46:45 UTC
From: Scott <acepilot@bloomer.net>
Message-ID: <SLydnb5zZpNx7Q3fRVn-uw@bright.net>
Source record: 76728

Well, I hope it works for the intended purpose. These filters are nice
in the fact that they are 50 Ohms in and out, so if they are being put
in line with a receiver, all that should be necessary is to tune it
up...the price isn't too terrible either!

3064. 40 Meter Half Square

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-22 11:54:08 UTC
From: Scott Gordon <sgordon@wowway.com>
Message-ID: <yd2dnV12Xdrz7w3fRVn-sw@wideopenwest.com>
Source record: 76729

Any one have any detailed plans on 40 Meter Half Square antenna? I calculated 33.33 feet on verticals and 68.33 on horizontal. I was thinking of feeding it at the corner, I think it will be close to 50 ohms. Now center should go to the vertical and shield to horizontal....Another question is the far end vertical is it connected or seperated from the horizontal connection?

It's not an exact science and you will have to trim for resonance
on your favorite frequency. Those are OK starting measurements.
The far end vertical wire is connected to the horizontal wire and
is usually just a continuation of the same wire with a 90 degree
bend. This is basically a phased array of two 1/4WL vertical
sections separated by 1/2WL and fed at a top corner or fed at
a bottom high impedance point through a base matching network.

Good morning, Bob.

Wouldn't the terminated folded dipole be too lossy at the lowest
frequencies of interest?

In any case it looks like a terminated folded dipole would cost at
least a full "S" unit over a dipole, at any frequency (and much more
than that down by the low end of the design range).

However, looking through L.B.'s website gave me another idea ... what
about a triband full wave loop similar to what is shown in the
attached JPEG? There would be a single wire on the "fed" side of the
loop, tapped off at points along its length to create anchor points
for the other three sides of a loop for each frequency.

Have any of you tried anything like that, and how did it work?

CJ

Unlike dipoles, there would be heavy interaction between the
loops on 40m. The feedpoint impedance of an 80m dipole is
very high on 40m and most of the power goes into the 40m
dipole. The feedpoint impedance of an 80m loop is low on
40m so the power is shared with sometimes unexpected results.
You can probably model it with the free demo version of EZNEC
available at www.eznec.com

Near enough for a start - trim for resonance, as Cecil says.

> I was thinking
>of feeding it at the corner, I think it will be close to 50 ohms.

That's where it must be fed. Anywhere else, and it won't act as a
half-square (except the other top corner of course).

>Now
>center should go to the vertical and shield to horizontal....

That shouldn't matter at all.... but you really need a choke balun to
make *sure* of that. Coil up the first few feet of your feedline to make
a common-mode choke at the feedpoint (eg 10ft of RG-58 feedline, wound
into a flat coil of 6 turns). Then run the rest of the feedline away
from either leg of the antenna for as far as possible.

If you use that choke, then it won't matter which way around you connect
the centre and the shield. If you don't, then your antenna will consist
of the half-square *plus* the outer of your coax... which was probably
not what you intended.

>Another
>question is the far end vertical is it connected or seperated from the

Connected.

Wow. Thanks Dave!

I'll have to find someone with a faster connection than my 28K dial-up
to fetch it for me, but great job.

It should work just fine. I have an 18 MHz dipole, which also serves as the support, and a 40 m inverted V hanging below that, fed through a current balun. There will be interaction, so it would be a good idea to model it in EZNEC first. You will want to trim the longest antennas first. Cut them a little long to start with, and when you go to shorten one, don't cut off all the extra wire, in case you have to go back. If the 4.5 is for receiving only, it may not be worth the bother.

It took a lot of going back and forth, but I have an EZNEC simulation of a 75/80 m antenna that has an swr below 2.0 from 3.5 to 4.0. If you do put up the 4.5 antenna, you can probably use that to extend the bandwidth of the 80 m antenna on the high side.

Yet in the minds of the conspiracists, HAARP is the greatest evil of
the modern technological era, with entire books having been written
about its "dangers."

THE MOST IMPORTANT QUESTION OF YOUR LIFE

This is the most important question of your life.

The question is: Are you saved?

It is not a question of how good you are, nor if you
are a church member, but are you saved?

Are you sure you will go to Heaven when you die?

The reason some people don't know for sure if they are
going to Heaven when they die is because they just
don't know.

The good news is that you can know for sure that you
are going to Heaven.

The Holy Bible describes Heaven as a beautiful place
with no death, sorrow, sickness or pain.

God tells us in the Holy Bible how simple it is to be
saved so that we can live forever with Him in Heaven.

"For if you confess with your mouth Jesus is Lord and
believe in your heart that God raised Him from the
dead, you will be saved." (Romans 10:9)

Over 2000 years ago God came from Heaven to earth in
the person of Jesus Christ to shed His blood and die
on a cross to pay our sin debt in full.

Jesus Christ was born in Israel supernaturally to a
virgin Jewish woman named Mary and lived a sinless
life for thirty-three years.

At the age of thirty-three Jesus was scourged and
had a crown of thorns pressed onto His head then
Jesus was crucified.

Three days after Jesus died on a cross and was placed in a grave He rose from the dead as He said would happen before He died.

If someone tells you that they are going to die and then three days later come back to life and it actually happens then this person must be the real deal.

Jesus Christ is the only person that ever lived a perfect sinless life.

This is why Jesus is able to cover our sins(misdeeds) with His own blood because Jesus is sinless.

The Holy Bible says, "In Him(Jesus) we have redemption through His blood, the forgiveness of sins..." (Ephesians 1:7)

If you would like God to forgive you of your past, present and future sins just ask Jesus Christ to be your Lord and Saviour.

It doesn't matter how old you are or how many bad things that you have done in your life including lying and stealing all the way up to murder.

Just pray the prayer below with your mouth and mean it from your heart and God will hear you and save you.

Dear Jesus Christ, I want to be saved so that I can have a home in Heaven with You when I die. I agree with You that I am a sinner. I believe that You love me and want to save me. I believe that You bled and died on the cross to pay the penalty for my sins and that You rose from the dead. Please forgive my sins and come into my heart and be my Lord and Saviour. Thanks Lord Jesus Christ for forgiving me and saving me through Your merciful grace. Amen.

Welcome to the family of God if you just allowed God to save you.

Now you are a real Christian and you can know for sure that you will live in Heaven forever when this life comes to an end.

As a child of God we are to avoid sin(wrongdoing), but if you do sin the Holy Bible says, "My dear children, I write this to you so that you will not sin. But if anybody does sin, we have one who speaks to the Father in our defense Jesus Christ, the Righteous One."

Those of you that have not yet decided to place your trust in the Lord Jesus Christ may never get another chance to do so because you do not know when you will die.

Jesus said, "I am the way, the truth and the life: no one
can come to the Father(God)(in Heaven), but by me."
(John 14:6)

This means that if you die without trusting in Jesus Christ
as your Lord and Saviour you will die in your sins and be
forever separated from the love of God in a place called Hell.

The Holy Bible descibes Hell as a place of eternal
torment, suffering, pain and agony for all those who
have rejected Jesus Christ.

The good news is that you can avoid Hell by allowing
Jesus Christ to save you today. Only then will you
have true peace in your life knowing that no matter
what happens you are on your way to Heaven.

Praise the Lord!
Servant of the Lord Jesus Christ
Ronald L. Grossi

3079. Re: 40 Meter Half Square

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-22 17:42:17 UTC
From: Jim Leder <k8cxm@spam.fuse.net>
Message-ID: <40c8e$4290c477$d844d1c5$25255@FUSE.NET>
Source record: 76744

Scott, I have been using a 30 meter HS for some time now, and according to my dimensions and EZNEC, I get 65'6" for the horizontal wire and 37'7" for the vertical 'tails'. However, what you are figuring may be close enough. The horizontal wire length wire will cause the 'tails' to be longer or shorter depending on what you make it. I've discovered that a SHORTER horizontal wire (not by too much) and longer tails seems to give a tad more gain, but not enough to notice. I did it so I could squeeze it in between 2 trees 46 feet apart (30 meters for mine, remember). Also, the coax can be connected to either the coax center conductor to the short vertical section or the longer section, it really doesn't matter. The longer section is one long, continuous section of wire, roughly 3 1/4 wavelengths long with the last 1/4 bent back towards ground to make the other vertical. The 1/2 wave section of horizontal wire is a phasing line for what an HS is: top load phased verticals. Corner load is what I do but find a way to keep the coax away from the vertical wire. Mine comes off at an angle to another nearby tree. It's easy to get interaction between the coax and the antenna and you need to avoid that. Also, I'd suggest a coax choke at the feedpoint. I get a 1.1:1 match at 10.1.

>Thanks.... CJ

Wes and I disagree, so you will have to toss a coin on this one. I
have built many of these multiband parallel dipoles over the years. I
still use them. Here is how I do mine.

I space the wires about 6-8 inches apart using the longest wire on top
and they get shorter as they go down. What I generally do is use a
long formula to set up the initial wires such as 495/f = length in
feet. Then I hang all the wires with the spacers. I trim the highest
frequency first and measure it out. I reverse the calculations to get
the X more accurately in the formula, X/f = L in Feet. I trim the
other two and I am done.

I have not tried this with an element so close in frequency as your
80/4.5 MHz elements, but I don't expect a problem. If you have an
antenna analyzer, you can see what the different elements are resonant
on and then calculate the reverse formula trimming only once per band.

The only real difference I see in the multiband parallel dipole is
that the bandwidth on 80 and 40 seem to be broader than on a single
dipole cut to frequency. I have read on some of these forums that
others are getting narrower bandwidth. I can't explain that.

If you have an eBay account, you can add it to your watch list and see
the results.

I would like to know more about this as my curiosity has been tweaked.
I did a search and find mostly works from the person but no
interaction that would cause such a letter.

Where might I learn more?

I'll admit that I havent played with the TFD but would agree that the resistive termination would introduce a 3dB power loss. One has to ask though whether that will be a problem at 80m given band noise etc.

To tell you the truth if I was trying for a 3.5, 4.5 and 7Mhz antenna I'd probably use just two (crossed) dipoles and figure a way to mechanically tune between the lower frequencies. Even lumped C comes to mind.

Only HF loop I ever played with was a 40m NVIS..

Cheers Bob VK2YQA

Actually it is slightly steerable...just over about 15 degrees of
vertical, and the antenna gain drops off, quickly as the the angle
leaves vertical. This is due to the movement of the Feed Horn
Assembly offcenter on its Trolly Wire Supports.

HAARP is far from benign, as the following "factoids" suggest...

An adult's head will resonate at a frequency between 350 and 400 MHz (megahertz). Being smaller, a child's head will resonate at a higher frequency, somewhere between 600 and 850 MHz.

... National Institute for Neurological Diseases warned that the frequency 388 MHz was noted to have a lethal effect on monkeys. Subsequent experiments with a milliwatt-power oscillator positioned several feet away from human subjects and swept through the 380-500 MHz range elicited a ?pulsing in the brain,? ringing in the ears ? and a powerful urge to sink their teeth into the experimenter!

... In that experiment, each individual appeared to have his own ?resonant? frequency, probably a function of the height of the body acting as a half-wave antenna. Most humans should resonate at around 82-85 MHz (TV channel 6; do you live near a TV transmitter?).

By 1930 Nrunori claimed that humans react to radio emissions at 129 MHz and its harmonics, while in the 1920?s Cazzamalli bombarded volunteer subjects with VHF radiation to induce hallucinations. He also claimed to have recorded re-radiated ?beats? of emotional reactions using an untuned galena crystal receiver and a galvanometer during the RF blitz from his?oscillatori telegrafica.?

Fifteen-meter (21 MHz) signals increase the germination of gladiolus bulbs while ten meter (29 MHz) energy kills bugs in bread!

The above came from two URLs:
http://www.gi.alaska.edu/ScienceForum/ASF3/386.html
http://www.totse.com/en/media/radio_free_amerika/humanrcv.html

The web is loaded with such info... many universities have done research... billions of watts (such as HAARP) is NO JOKE!!!

Warmest regards,
John

The work was done using only noncommercial (freely-distributable)
software tools... the SANE scanning software, NETPBM image-processing
programs, The GIMP for manual image processing, and GPL GhostScript to
create the PDFs. I wrote a bunch of custom scripts to perform some
higher-level functions (e.g. automatically levelling, centering, and
"bleaching" the pages).

The text is not searchable. I don't have access to OCR software which
can do the job with acceptable accuracy, nor the time required to
proofread the whole book and correct the inevitable errors. The PDF
text is all in graphic format.

CJ,
I ran an EZNEC simulation on a pair of crossed dipoles at 3.7 and 4.5 MHz,
with a 7.2 MHz inverted V below the 3.7. Not good. The 7.2 works OK, but the
4.5 really messes up the 3.7. Among other things the impedance at 3.7 and
4.5 MHz is about 115 Ohms. I ran the simulation at 50 feet above average
ground. If the 4.5 is for receive only, I would forget about it, and take
the 10:1 SWR that the 80 meter dipole gives you.

Here is a guy with an interesting balun design--and provides EXCELLENT construction details, two cores are needed--however, you end up with 1:1 - 1:2 and 1:4 ratios, all in one balun... interesting design... I think it is inspired by Dr. sevicks' work...
http://www.qsl.net/wb6zqz/3in1balun/construct.html

Laser Could Rival Energy From Sun's Center
By H. JOSEF HEBERT, Associated Press Writer 2 hours, 48 minutes ago
LIVERMORE, Calif. - Ed Moses talks of the "grand challenge" that has consumed him for the past five years, comparing it to trying to hit the strike zone with a baseball from 350 miles away or tossing a dime into a parking meter from 40 miles. "That's the precision we have to have," says Moses, the director of a high-energy physics adventure to produce the world's most powerful laser - one that scientists hope will create in a laboratory the energy found at the center of the sun.

ADVERTISEMENT

In a building the size of a football stadium, engineers have assembled the framework for a network of 192 laser beams, each traveling 1,000 feet to converge simultaneously on a target the size of a pencil eraser.

The trip will take one-thousandth of a second during which the light's energy is amplified many billions of times to create a brief laser pulse 1,000 times the electric generating power of the United States.

The goal is to create unimaginable heat - 180 million degrees Farenheit - and intense pressure from all directions on a BB-size hydrogen fuel pellet, compressing it to one-thirtieth of its size.

The result, the scientists hope, will be a fusing of atoms so that more energy is released than is generated by the laser beams, something scientists call fusion ignition. It is what happens when a hydrogen bomb explodes.

Four of the beams have been tested. When completed in 2008, the National Ignition Facility, or NIF, as the laser at the Lawrence Livermore National Laboratories is called, will dwarf many times over any laser to date.

It will provide a platform for many experiments in high-energy and high-density physics, from learning more about the planets and stars to advancing the elusive hunt for fusion energy to generate electric power, Moses says.

"You have to think of this like the Hubble," he says, referring to the space telescope. "It's a place where you will see things and do things that you couldn't do anywhere else."

The government is investing $3.5 billion, and possibly several billion dollars more, in NIF for another reason: national security.

If NIF achieves fusion ignition, it will for the first time in a laboratory simulate the pressures and heat of a nuclear explosion, allowing nuclear weapons scientists to study the performance and readiness of the country's aging nuclear arsenal without actually detonating a nuclear device.

Underground nuclear testing in the Nevada desert ended in 1992.

The NIF laser "is essential to assessing the potential performance of nuclear weapons," says Energy Secretary Samuel Bodman. He says the experiments will help determine the effects of aging on warheads and help assure they will work as expected, should they be needed.

There have been other lasers, including a 10-beam Livermore project called Nova. NIF will produce 40 times to 60 times more energy. "It's the difference between a car and a jet engine," Moses says.

For many supporters the "pass-fail" is whether the NIF lasers will achieve fusion ignition.

"We never intended to spend $5 billion to $6 billion to build a laser facility for ... civilian research," Sen. Pete Domenici (news, bio, voting record), R-N.M., chairman of the Senate subcommittee that funds the NIF program, lectured an Energy Department scientist last year when he learned fusion ignition experiments might be postponed.

Energy Department officials now say the project remains on schedule with the first fusion ignition tests planned for 2010. Domenici remains skeptical.

"It's a terrible expense and a drain" on other programs to maintain the nuclear arsenal, Domenici said in an interview. "They're going to have to prove they can get the job done."

Among some people, fusion ignition "has become the poster child for NIF being successful" and that shouldn't be the case, counters George Miller, a former nuclear weapons designer and bomb tester who heads the project. He says there are many other experiments for which NIF will be valuable to nuclear weapons scientists.

"We are conscious of the importance of ignition" and "there's no reason to think we're not going to get it," Linton Brooks, head of the federal National Nuclear Security Administration that oversees the country's nuclear weapons arsenal, said in an interview.

But at a recent Senate hearing, Brooks said a 14 percent budget cutback in the fusion ignition program creates "additional risks" that fusion ignition may not be achieved in the 2010 timeframe.

The NIF program has had a decade of turbulent history marked by exhilarating successes and embarrassing setbacks, large cost overruns and charges by some critics that the project was oversold from the beginning to win initial support in Congress.

When the idea of a new, super laser first emerged in the early 1990s, the cost was put at less than $700 million. By the time construction began in 1997, the price had grown to $2.1 billion with completion by 2004; three years later it ballooned to $3.3 billion and the completion date delayed four years. Critics contend the price is now up to $5 billion when associated expenses such as developing a target capsule capable of achieving fusion ignition are included.

"If Congress knew it would cost $5 billion up front, would they ever have funded it? No way," maintains Christopher Paine, who has monitored NIF's development for the Natural Resources Defense Council, an environment advocacy group, and has been one of its sharpest critics.

Despite its price escalation and remaining uncertainties, NIF maintains strong support in both Congress and the Bush administration. However, there have been other high-energy physics projects on which billions of dollars have been spent only to be dumped.

Congress pulled the plug in 1993 on the Superconducting Super Collider project, a racetrack-like device in Texas to study elementary particles and forces, after spending $2 billion. The Clinch River Breeder Reactor project in Tennessee was canceled a decade earlier after $1.7 billion had been spent as the United States abandoned nuclear fuel reprocessing. Both projects had large cost overruns.

Paine, who in a critique once dubbed NIF "The Unlovable Laser," maintains that NIF should follow the same path. He says it isn't needed and poses a nuclear proliferation risk because it might make it easier in decades ahead to develop new nuclear weapons, not just maintain existing ones.

The JASONs, a group of scientists frequently called upon to review complex defense or national security issues, has concluded that NIF "does not represent a significant proliferation risk" and is "fully compatible" with U.S. nonproliferation goals.

Still, a recent report by the Defense Science Board, which advises the Pentagon, urged more openness about NIF activities and a mix of civilian and defense NIF experiments to ease any public concerns about the laser's purpose.

The question of openness has been an issue before.

The program's critics charge that Livermore officials lowballed NIF's capabilities and potential cost from the beginning. When Congress was sold on NIF's importance because of its ability to simulate a nuclear explosion, scientists were at best only half certain fusion ignition could be accomplished, NIF program supporters acknowledge today.

Three years after NIF construction began, congressional auditors concluded in a 2000 report, "Congress cannot know with assurance just how much NIF will cost ... what impact NIF will have on the overall nuclear weapons program, or how long it will take to complete."

That report and others were prompted by discovery in late 1999 that engineers had encountered a serious problem installing the laser's optics and had hidden it from senior Energy Department officials and Congress.

In short, they could not keep the optics free of dust. To fix the problem would add $350 million to the project's cost. Even as engineers scrambled to try to find a solution, Livermore officials were telling then-Energy Secretary Bill Richardson that the program was on schedule and within budget.

"I remember being shell-shocked," Richardson said in an interview. "I had just been at the facility the month before and I had been briefed and pronounced (the laser program) in sound shape, a vision for the future."

It didn't help that NIF's project director also had just resigned after it was discovered he never completed work on a doctoral thesis and that a string of outside reviewers failed to identify any shortcomings with the project.

"The problem was, we had people doing this that did not appreciate the scale of what they were attempting to do," says Moses, a laser engineer and longtime senior manager at Livermore, who was brought in to lead the NIF program in late 1999. Those who had the vision of NIF found it was more complicated when it came to actually building it, he said.

The new team tackled a variety of problems.

By 2003, the dust issue was solved by building a massive clean room and installing the optics in modular dust-free units. Engineers found new ways to produce the thousands of highly polished pieces of laser glass. A faster way was found to grow high-quality crystals that convert the beams to ultraviolet just before they strike the target.

And with four of the planned 192 beams operating, new tests suggested strongly that when the system was fully operating, enough energy would be produced to - theoretically, at least - achieve ignition.

Last year, however, a new complication emerged - not over the laser but the pea-size pellet that contains the hydrogen fuel that will be ignited by the lasers to achieve fusion ignition. Could the pellet be manufactured to the required specifications?

Once its shell was to be made of plastic, but that idea was abandoned. Now the choice is beryllium, a metallic element that can withstand intense heat, is molecularly stable and is a good conductor.

It still is uncertain whether beryllium can be machined to specification, according to technicians who have monitored the program. Last year Congress directed another outside review to report how the development of a beryllium target might affect NIF's timetable.

Like previous challenges in the project's history, the beryllium issue will be resolved, Miller and Moses believe.

While the massive laser may one day have a broad range of scientific uses - some not even envisioned by today's scientists - the immediate focus remains assuring the reliability of the nation's nuclear arsenal without actually testing the weapons.

"It gives us confidence that the nuclear stockpile stewardship approach will work," Miller says.

"That's the precision we have to have," says Moses, the director of a high-energy physics adventure to produce the world's most powerful laser - one that scientists hope will create in a laboratory the energy found at the center of the sun.

ADVERTISEMENT

In a building the size of a football stadium, engineers have assembled the framework for a network of 192 laser beams, each traveling 1,000 feet to converge simultaneously on a target the size of a pencil eraser.

The trip will take one-thousandth of a second during which the light's energy is amplified many billions of times to create a brief laser pulse 1,000 times the electric generating power of the United States.

The goal is to create unimaginable heat - 180 million degrees Farenheit - and intense pressure from all directions on a BB-size hydrogen fuel pellet, compressing it to one-thirtieth of its size.

The result, the scientists hope, will be a fusing of atoms so that more energy is released than is generated by the laser beams, something scientists call fusion ignition. It is what happens when a hydrogen bomb explodes.

Four of the beams have been tested. When completed in 2008, the National Ignition Facility, or NIF, as the laser at the Lawrence Livermore National Laboratories is called, will dwarf many times over any laser to date.

It will provide a platform for many experiments in high-energy and high-density physics, from learning more about the planets and stars to advancing the elusive hunt for fusion energy to generate electric power, Moses says.

"You have to think of this like the Hubble," he says, referring to the space telescope. "It's a place where you will see things and do things that you couldn't do anywhere else."

The government is investing $3.5 billion, and possibly several billion dollars more, in NIF for another reason: national security.

If NIF achieves fusion ignition, it will for the first time in a laboratory simulate the pressures and heat of a nuclear explosion, allowing nuclear weapons scientists to study the performance and readiness of the country's aging nuclear arsenal without actually detonating a nuclear device.

Underground nuclear testing in the Nevada desert ended in 1992.

The NIF laser "is essential to assessing the potential performance of nuclear weapons," says Energy Secretary Samuel Bodman. He says the experiments will help determine the effects of aging on warheads and help assure they will work as expected, should they be needed.

There have been other lasers, including a 10-beam Livermore project called Nova. NIF will produce 40 times to 60 times more energy. "It's the difference between a car and a jet engine," Moses says.

For many supporters the "pass-fail" is whether the NIF lasers will achieve fusion ignition.

"We never intended to spend $5 billion to $6 billion to build a laser facility for ... civilian research," Sen. Pete Domenici (news, bio, voting record), R-N.M., chairman of the Senate subcommittee that funds the NIF program, lectured an Energy Department scientist last year when he learned fusion ignition experiments might be postponed.

Energy Department officials now say the project remains on schedule with the first fusion ignition tests planned for 2010. Domenici remains skeptical.

"It's a terrible expense and a drain" on other programs to maintain the nuclear arsenal, Domenici said in an interview. "They're going to have to prove they can get the job done."

Among some people, fusion ignition "has become the poster child for NIF being successful" and that shouldn't be the case, counters George Miller, a former nuclear weapons designer and bomb tester who heads the project. He says there are many other experiments for which NIF will be valuable to nuclear weapons scientists.

"We are conscious of the importance of ignition" and "there's no reason to think we're not going to get it," Linton Brooks, head of the federal National Nuclear Security Administration that oversees the country's nuclear weapons arsenal, said in an interview.

But at a recent Senate hearing, Brooks said a 14 percent budget cutback in the fusion ignition program creates "additional risks" that fusion ignition may not be achieved in the 2010 timeframe.

The NIF program has had a decade of turbulent history marked by exhilarating successes and embarrassing setbacks, large cost overruns and charges by some critics that the project was oversold from the beginning to win initial support in Congress.

When the idea of a new, super laser first emerged in the early 1990s, the cost was put at less than $700 million. By the time construction began in 1997, the price had grown to $2.1 billion with completion by 2004; three years later it ballooned to $3.3 billion and the completion date delayed four years. Critics contend the price is now up to $5 billion when associated expenses such as developing a target capsule capable of achieving fusion ignition are included.

"If Congress knew it would cost $5 billion up front, would they ever have funded it? No way," maintains Christopher Paine, who has monitored NIF's development for the Natural Resources Defense Council, an environment advocacy group, and has been one of its sharpest critics.

Despite its price escalation and remaining uncertainties, NIF maintains strong support in both Congress and the Bush administration. However, there have been other high-energy physics projects on which billions of dollars have been spent only to be dumped.

Congress pulled the plug in 1993 on the Superconducting Super Collider project, a racetrack-like device in Texas to study elementary particles and forces, after spending $2 billion. The Clinch River Breeder Reactor project in Tennessee was canceled a decade earlier after $1.7 billion had been spent as the United States abandoned nuclear fuel reprocessing. Both projects had large cost overruns.

Paine, who in a critique once dubbed NIF "The Unlovable Laser," maintains that NIF should follow the same path. He says it isn't needed and poses a nuclear proliferation risk because it might make it easier in decades ahead to develop new nuclear weapons, not just maintain existing ones.

The JASONs, a group of scientists frequently called upon to review complex defense or national security issues, has concluded that NIF "does not represent a significant proliferation risk" and is "fully compatible" with U.S. nonproliferation goals.

Still, a recent report by the Defense Science Board, which advises the Pentagon, urged more openness about NIF activities and a mix of civilian and defense NIF experiments to ease any public concerns about the laser's purpose.

The question of openness has been an issue before.

The program's critics charge that Livermore officials lowballed NIF's capabilities and potential cost from the beginning. When Congress was sold on NIF's importance because of its ability to simulate a nuclear explosion, scientists were at best only half certain fusion ignition could be accomplished, NIF program supporters acknowledge today.

Three years after NIF construction began, congressional auditors concluded in a 2000 report, "Congress cannot know with assurance just how much NIF will cost ... what impact NIF will have on the overall nuclear weapons program, or how long it will take to complete."

That report and others were prompted by discovery in late 1999 that engineers had encountered a serious problem installing the laser's optics and had hidden it from senior Energy Department officials and Congress.

In short, they could not keep the optics free of dust. To fix the problem would add $350 million to the project's cost. Even as engineers scrambled to try to find a solution, Livermore officials were telling then-Energy Secretary Bill Richardson that the program was on schedule and within budget.

"I remember being shell-shocked," Richardson said in an interview. "I had just been at the facility the month before and I had been briefed and pronounced (the laser program) in sound shape, a vision for the future."

It didn't help that NIF's project director also had just resigned after it was discovered he never completed work on a doctoral thesis and that a string of outside reviewers failed to identify any shortcomings with the project.

"The problem was, we had people doing this that did not appreciate the scale of what they were attempting to do," says Moses, a laser engineer and longtime senior manager at Livermore, who was brought in to lead the NIF program in late 1999. Those who had the vision of NIF found it was more complicated when it came to actually building it, he said.

The new team tackled a variety of problems.

By 2003, the dust issue was solved by building a massive clean room and installing the optics in modular dust-free units. Engineers found new ways to produce the thousands of highly polished pieces of laser glass. A faster way was found to grow high-quality crystals that convert the beams to ultraviolet just before they strike the target.

And with four of the planned 192 beams operating, new tests suggested strongly that when the system was fully operating, enough energy would be produced to - theoretically, at least - achieve ignition.

Last year, however, a new complication emerged - not over the laser but the pea-size pellet that contains the hydrogen fuel that will be ignited by the lasers to achieve fusion ignition. Could the pellet be manufactured to the required specifications?

Once its shell was to be made of plastic, but that idea was abandoned. Now the choice is beryllium, a metallic element that can withstand intense heat, is molecularly stable and is a good conductor.

It still is uncertain whether beryllium can be machined to specification, according to technicians who have monitored the program. Last year Congress directed another outside review to report how the development of a beryllium target might affect NIF's timetable.

Like previous challenges in the project's history, the beryllium issue will be resolved, Miller and Moses believe.

While the massive laser may one day have a broad range of scientific uses - some not even envisioned by today's scientists - the immediate focus remains assuring the reliability of the nation's nuclear arsenal without actually testing the weapons.

"It gives us confidence that the nuclear stockpile stewardship approach will work," Miller says.

The original scans are 300 dpi grayscale, PGM (portable graymap)
format. Easily translated to TIFF.

The data in the PDF itself is 300 dpi one-bit-deep black&white data,
compressed... converted from the grayscale data via thresholding.

Laser Could Rival Energy From Sun's Center
By H. JOSEF HEBERT, Associated Press Writer 2 hours, 48 minutes ago
LIVERMORE, Calif. - Ed Moses talks of the "grand challenge" that has consumed him for the past five years, comparing it to trying to hit the strike zone with a baseball from 350 miles away or tossing a dime into a parking meter from 40 miles. "That's the precision we have to have," says Moses, the director of a high-energy physics adventure to produce the world's most powerful laser - one that scientists hope will create in a laboratory the energy found at the center of the sun.

ADVERTISEMENT

In a building the size of a football stadium, engineers have assembled the framework for a network of 192 laser beams, each traveling 1,000 feet to converge simultaneously on a target the size of a pencil eraser.

The trip will take one-thousandth of a second during which the light's energy is amplified many billions of times to create a brief laser pulse 1,000 times the electric generating power of the United States.

The goal is to create unimaginable heat - 180 million degrees Farenheit - and intense pressure from all directions on a BB-size hydrogen fuel pellet, compressing it to one-thirtieth of its size.

The result, the scientists hope, will be a fusing of atoms so that more energy is released than is generated by the laser beams, something scientists call fusion ignition. It is what happens when a hydrogen bomb explodes.

Four of the beams have been tested. When completed in 2008, the National Ignition Facility, or NIF, as the laser at the Lawrence Livermore National Laboratories is called, will dwarf many times over any laser to date.

It will provide a platform for many experiments in high-energy and high-density physics, from learning more about the planets and stars to advancing the elusive hunt for fusion energy to generate electric power, Moses says.

"You have to think of this like the Hubble," he says, referring to the space telescope. "It's a place where you will see things and do things that you couldn't do anywhere else."

The government is investing $3.5 billion, and possibly several billion dollars more, in NIF for another reason: national security.

If NIF achieves fusion ignition, it will for the first time in a laboratory simulate the pressures and heat of a nuclear explosion, allowing nuclear weapons scientists to study the performance and readiness of the country's aging nuclear arsenal without actually detonating a nuclear device.

Underground nuclear testing in the Nevada desert ended in 1992.

The NIF laser "is essential to assessing the potential performance of nuclear weapons," says Energy Secretary Samuel Bodman. He says the experiments will help determine the effects of aging on warheads and help assure they will work as expected, should they be needed.

There have been other lasers, including a 10-beam Livermore project called Nova. NIF will produce 40 times to 60 times more energy. "It's the difference between a car and a jet engine," Moses says.

For many supporters the "pass-fail" is whether the NIF lasers will achieve fusion ignition.

"We never intended to spend $5 billion to $6 billion to build a laser facility for ... civilian research," Sen. Pete Domenici (news, bio, voting record), R-N.M., chairman of the Senate subcommittee that funds the NIF program, lectured an Energy Department scientist last year when he learned fusion ignition experiments might be postponed.

Energy Department officials now say the project remains on schedule with the first fusion ignition tests planned for 2010. Domenici remains skeptical.

"It's a terrible expense and a drain" on other programs to maintain the nuclear arsenal, Domenici said in an interview. "They're going to have to prove they can get the job done."

Among some people, fusion ignition "has become the poster child for NIF being successful" and that shouldn't be the case, counters George Miller, a former nuclear weapons designer and bomb tester who heads the project. He says there are many other experiments for which NIF will be valuable to nuclear weapons scientists.

"We are conscious of the importance of ignition" and "there's no reason to think we're not going to get it," Linton Brooks, head of the federal National Nuclear Security Administration that oversees the country's nuclear weapons arsenal, said in an interview.

But at a recent Senate hearing, Brooks said a 14 percent budget cutback in the fusion ignition program creates "additional risks" that fusion ignition may not be achieved in the 2010 timeframe.

Good evening, Tam.

Thanks for running the simulation for me. Your results don't surprise
me much.

(I'm going to have to get that EZNEC program and play with it for a
while ... thanks to all for mentioning it.)

The 4.5-MHz antenna will be used for transmitting as well as
receiving, and so I need to get the SWR down to something reasonable.

I guess there's no reason why I can't just put up a separate dipole
for 4.5 MHz and the crossed dipoles, fed with a single coax, for 80
and 40.

I could also (and I might...) just put up an 80-meter dipole fed with
ladder line and use a tuner, though I was trying to avoid the tuner.

Thanks (to you and to all) for saving me a bunch of work. :-)

CJ

I rather strongly suspect that if you model this out, you'll find that
the antenna's behavior will be drastically changed by reversing the
stubs. The results may not be to your liking.

That url above does not have the item you ordered. Did you mean to
paste this one:
http://www.cell-phone-accessories.com/moc6cephanbo.html

The above one has Motorola C650 antenna that does not require a port on
the phone. It attaches to the back of the phone with velcro attachment.
That should solve your no-port problem and give better reception up
yonder.

Other than that tiny corner of your mind that harbors this idea where does this article have anything to do with the High Frequency Active Auroral Research Program? Do you know what that is? Hello, Hello

3108. Re: 40 Meter Half Square

Ian said:

That's where it must be fed. Anywhere else, and it won't act as a
half-square (except the other top corner of course).

==========

eh?

Fed at the bottom via a parallel tuned circuit works, no ? You can see my article in Ham Radio Magazine from many years ago on how to feed it that way, (which is really the classical feed for this antenna...the corner fed, with all of it's inherent problems came along a lot later, AFAIK)

Simply use a parallal tuned circuit at the base of either vertical, and tap up from the bottom (ground side) of the coil for 50 ohms. The tuning cap for the coil can be a piece of coax (at "x" pf per foot). I ran this antenna for years, and I had the mistaken notion that it was a "half-square". Wonders never cease...I would have thought the editor of the mag, a seemingly knowledgable fellow, would have caught my mistake.

<very big grin, tongue in cheek>

This site has come up with this antenna to counter that no-port
problem. It does not require an antenna port:
http://www.cell-phone-accessories.com/moc6cephanbo.html

This means that it is good for any phone.

Dave:

Are you familiar with microsoft reader... it reads ebooks in something of a "paperback style." I am not sure if there is a counterpart in the Linux world... are you dual boot?

Warmest regards,
John

Comon, now - The image is crappy but that velcro antenna may be a good idea for those phones that do not have an external antenna port. Enlighten me about why you think it is junk. I mean, I would really like to know if you care to elaborate just a tad bit more to support your argument. Thanks.

A cheap and effective solution is to purchase a Van Gordon 130 foot all band dipole $29.95 with 100 feet of ladder line.

Purchase an additional 100 foot of 450 ohm ladderline $12.00.

find 7 4PDT relays and 2 digitran decimal to binary switches.

use the relays to switch in 1,2,4,8,10,20, and 40 feet of additional ladder line. cut 10 feet off of the 100 feet that came with the antenna. Now use the relays to add length as needed to tune. For example to tune your 4.5 would require switching in an additional 78 feet.

E-Mail me and I will send you a chart of frequency Vs what you need to switch in. I found the relays for a buck a piece and the digital rotary switches for 3 bucks. feed with your choice of coax with ferrite beads to act as a balun and your good to go.

Less than $50.00 and I cover nearly DC to Daylight, no tuner and worst SWR anywhere 1.4:1

Gladly, but, how do I get an ASCII file out of it. I thought I had opened
EZNEC files in Notepad, but it is garbage. Also, even from within EZNEC when
I click on View File, I get the same garbage as Notepad. The only
questionable thing I did would be the 0.2 foot stub in the middle that the
other wires are connected to; but that works for other configurations.

Just go back in time on this conference a few years back. He used to send out his nastygrams to anyone who derided his fractal antenna.

He saw more enemies than Nixon!

In a single day it was not unusual to see 10 threats of lawsuits against various denizens of this conference.

As is my perverse nature, I reveled in tweaking him. I have several of the type on E-Bay as well as from his "attorney" telling me to cease and desist the manufacture of fractal antennas.

Easy, two dipoles at right angles. One wire is 133 feet long, the other is
119. The height I used was 75 feet over average ground. I double checked
the SWR. It is below 2:1 from 3.5 to 4.0. If you do it at 75 Ohms, the SWR
is below 1.5:1 from 3.55 to 3.975.

"Attenuation" implies the conversion of EM energy to heat.
There's nothing in empty space to cause that conversion.

When all is said and sifted, what you have here is a slightly
overpowered ionosonde. Do a little math on how much of the output power
is left after inverse square losses at the altitude of the ionosphere...

Despite the kook brigades frothing, (they variously claimed that it is
able to control weather, make earthquakes and shoot down spacecraft in
LEO) the amount of field strength at altitude is about enough to run an
electric train. Toy electric train.....

Oh and it's not really that unique either, there are some sites in
Europe that have similar power levels.

The rest of FUD is just whacko kook froth and pseudoscience and can be
treated accordingly.

Excessive crossposting to kook groups (alt.fan.art.bell - alt.conspiracy
etc) removed to avoid encouraging kook invasions of mainstream groups....

The CO

It's also what has happened with several girlfriends. No laser beams
required even, so if you figure that it may have taken only a few thousands
or tens of thousands of dollars to make _them_ nuclear weapons, I am
surprised that the authorities haven't contacted me.

I would however prefer to be referred to as the SIFPP - "Semi-Intelligent
Fusion Production Platform." The major failure of SIFPP has been budgetary
constraints...I only make so much money, so the production of an AFDD
("Autonomous Female Destruction Device") has tested my wallet to its limits.

[SNIP]

Jesus, I could hope for a better name than "National Ignition Facility."
I'll admit that it's better than GCTC (Global Conflagration Testing Centre)
or HUCTZ (Hyper Universe Collapse Test Zone) [*]. I just am aware that being
in Nova Scotia, if the USA ignites, so may the closest parts of Canada, and
I am in one of those parts. I am not keen to move to the SDB ("Sandstrom
Deep Bunker") in Labrador.

AHS

* The projects exist, but are so black as to be ebony. But be afraid - be
very afraid.

You certainly have a point... I don't see anything there!

But, yes, joking aside--you do seem to be right...

However, like a sound wave needs a tuning fork whose proper size and substance it can resonate with... that either is vibrating (the wave is impacting the material of the either in some mysterious way)... or some component of it is impacted... change/movement does imply loss of energy (here in the real world by friction and heat creation)... and, not "loss" anyway... but the transformation of matter from one form to another (no matter can ever be destroyed in our real world)... but if there is no loss (attenuation actually) then it is a perfect conductor of both the magnetic and electrical components of the wave, at all temperatures... something we claim not to have seen, yet... hard to believe--but almost HAS to be happening...

Warmest regards,
John

Not familiar with it, don't really care to be. I have a policy of avoiding the use of Microsoft software on my systems except when no decent alternative exists.

> I am not sure if there is a counterpart in the Linux
>world...

Adobe Acrobat Reader has a "continuous, facing" display option - pairs of pages side by side - which I suspect is close to the "paperback style" to which you refer. Works fine with the PDFs I'm distributing.

> are you dual boot?

No, I don't trust that mode, for a couple of reasons. Some M$ operating systems are known to rather aggressively overwrite or destroy other OS's partitions or boot blocks, sometimes without asking or warning. And, given all of the security exploits against Windows and Explorer and etc. floating around, I feel safer not allowing Windows to have direct access to my hardware.

I do occasionally run Windows (usually Win98) in a VmWare virtual machine, with a virtualized hard drive, for things like tax software, ham-radio programming utilities, etc.. That way, it's running safely in user mode, can't get to the real hardware, and I can wipe it and start over from a checkpoint save without affecting the rest of my system.

Getting it down to 1 meg would necessarily sacrifice almost all of the
detail in the photographs - they'd be unviewable. 1 meg might be
enough space for the text, and possibly for the black&white charts and
line drawings (as bitmaps) but the photos would be lost.

"For Pete's sake" is an interesting American exclamation. How did it
arise?

Did it arise in the 1930's? Any connection with the villain Pegleg
Pete who appeared in Mickey Mouse cartoons of that era?

The pics would be converted to .jpeg... the text, in an efficient ebook format, would be held compressed--very small... I did say one-meg+, I was thinking about the pics (graphics) when I included the '+'... black and white compresses very small, gray scale not as well... still, 33 megs is HUGE! I don't see it being any larger then 3 megs at worst case... 1/10 is good...

Warmest regards,
John

Ahhhh, a "Linux Warrior" serving in the Linux Army seeking world conquest...

Probably about 90%+ (at the very least 80%) of all computer users are windows based... I simply think of the biggest audience (greatest good-greatest number, America used to be like that--I miss it...)

I go between Linux and Windows as necessary, my recreation machine is Slackware based (mp3s, movies, personal coding, etc...) ... Mac I avoid (but, they can run Linux)... those guys (Mac'ers) are worse then Bill when it comes to proprietary rights and control...

.pdf is great, but huge...

I thought you were more interested in the free sharing of info than fighting operating system wars... nothing wrong with either... both serve a purpose--but best done one at a time...

Warmest regards,
John

The reason it's 33 MB and not 1 MB is because the .pdf file is basically a bunch of pictures, one of each page. That's also why it's not searchable, and why you can't cut and paste text out of it.

33 MB is on the small side for books scanned like this.

In comparison, the Bible is only 1.34 MB in size in text format after being compressed (http://www.gutenberg.org/etext/10) -- and it's a big book. Even War and Peace is only 1.16 MB (http://www.gutenberg.org/etext/2600).

In order to get it under 1 MB, you'd generally have to use some sort of OCR software to convert the picture of text into text. I presume there would also be some pictures, and they'd have to be stored as pictures, of course.

Unfortunately, good OCR software is hard to find, and I know of no software that could take a book, scan it, convert it to text and images as appropriate, and do it accurately enough that a human wouldn't need to proofread the entire document carefully. And that is a very large job.

The reason it's available with BitTorrent is because that allows lots of people to download it relatively quickly without totally sucking up his bandwidth. It may be a bit more work to download than something that's just a link on a web page, but it works nicely once set up.

In any event, scanning and distributing out of copyright books like this is a worthy endeavor. Thank you!

Looks like there's a few other radio related works on Project
Gutenberg. Go to `http://www.gutenberg.org/catalog/world/search' and
search for `radio' for a list. None seem to cover antennas
specifically, but ` The Radio Amateur's Hand Book' looks interesting.

Fine Reader has no equal, still must be proof read, but I am always surprised how accurate it is, when pages have been scanned at high enough pixels... 200 is good, 300+ is excellent... it is smart and knows pictures when it sees them... all this is easy to suck into word and put a book together rather quickly... microsoft provides a FREE (what was Bill thinking!) plugin for Microsoft Word which will construct a .lit ebook from any word doc and presto... you have a ebook of excellent format--and even with pics--small...

The guys on the #ebooks chan on the undernet servers of IRC used to provide such books and info on how to create them--it is where I picked it up at... they create books in all formats... but for quality and size, .lit is what appeared best to me... microsoft provides a FREE (what was Bill thinking?--again!) reader to read them, called "Microsoft Reader."

Warmest regards,
John

3154. [newbie] Inverted V antenna installation - high SWR?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-23 05:35:37 UTC
From: "vu3rdd@gmail.com" <vu3rdd@gmail.com>
Message-ID: <1116826537.542654.15180@g43g2000cwa.googlegroups.com>
Source record: 76669

Hi,

I am a new radio amateur from India (I got my license only a couple of months back). My callsign is VU3RDD. This is my first experience with Radio installation, so the questions and the problem I am facing may be too silly and stupid. Neverthless... here it goes.

I live in an apartment on first floor. My inverted V for 40m and 20m are on concrete terrace (of the 5 floor apartment). The mast is about 10 ft high. The ends of the dipole are not very symmetrically tied, as the space constraints do not permit so. One of the ends of the dipole is facing north and the other end towards west. Not exactly 90 degree wide, but probably 100 to 120 degrees wide. The hight of the ends from the terrace is not the same. I purchased a used rig last week and when I measured the SWR, it sometimes hits 2:1, and sometimes more (if I shout at the mic) for both 20m and 40m.

I have afew questions.

1. What are the ways to improve my antenna installation?

2. Does the concrete terrace act as ground for the antenna, and is 10 ft mast, just too short a height. The terrace itself is at around 50 ft from the Ground.

3. I run a low loss RG213 coax from the terrace. Does the loss in the cable contribute to the high SWR I am seeing?

Any other suggestions or general observations about this setup and hopw I can improve the antenna setup? I also plan to learn NEC and simulate this setup (hope it is possible to do it with NEC).

Thanks

Hi Doug,

Also from Gutenberg (along with several dozen other titles) is my copy
of Casanova's Memoires (which fits in my Palm Tungsten E as an ebook).
It runs to 3.9 MB (about two feet of bookshelf space). No pictures by
the way.

>good-greatest number, America used to be like that--I miss it...)

... and all of those Windows users can, if they choose, view PDF
documents. "Portable", y'know? The Adobe software is free, and works
fine.

What I'm not particularly interested in doing, is creating a
non-portable (Windows-specific) version. Why restrict the usability?

If you want to do so, go right ahead... as long as you comply with the
simple "noncommercial, share and share alike" copyright terms on the
PDF, you can create a further derivative work to suit yourself.

I'll be curious how many tens, or hundreds of hours of work it takes
to develop a suitably-high-quality textual representation of this
book. Do let us know!

>I go between Linux and Windows as necessary, my recreation machine is
>Slackware based (mp3s, movies, personal coding, etc...) ... Mac I avoid
>(but, they can run Linux)... those guys (Mac'ers) are worse then Bill when
>it comes to proprietary rights and control...

And that's pretty much why I stopped using (and developing software)
for my Mac, put it into retirement, and switched to Linux. (Could
have been a *BSD derivative, but there was a big two- or three-way war
going on within the *BSD camp at the time).

>.pdf is great, but huge...

By today's standards?

>I thought you were more interested in the free sharing of info than fighting
>operating system wars...

I am. You raised the subject, and I simply answered the question to
explain why I'm not personally interested in doing what you want.

I've done what I set out to do - get this work back into public
availability, in a useful form. If that form does not suit your
desires, that's your issue, not mine, and you're free to correct the
situation.

Hi Ramakrishnan,

Welcome to the fraternity. What you describe are common enough
problems and part of the "fun" of the hobby. Antennas are the last
frontier (which is to say you have to spend a lot of money to buy one
that works as advertised - and only if you spent far more to obtain a
tower).

>

No problem with this either.

> I purchased a used rig last week and when
>I measured the SWR, it sometimes hits 2:1, and sometimes more (if I

This should really be done in CW mode, not voice mode.

>I have afew questions.
>
>1. What are the ways to improve my antenna installation?

By any number of ways, but what you have is in many ways far ahead of
the general Ham. That is, you have an asset with more than adequate
height for the bands you describe.

>2. Does the concrete terrace act as ground for the antenna, and is 10
>ft mast, just too short a height. The terrace itself is at around 50 ft
>from the Ground.

I presume you mean, by mast, that it is 10 feet out from the terrace
which is 50 feet above ground. That is all fine and well, but you say
nothing of the dipole ends. That is, their height above ground. It
shouldn't matter too much, unless they are planted into the ground.

>3. I run a low loss RG213 coax from the terrace. Does the loss in the
>cable contribute to the high SWR I am seeing?

No, loss if anything will tend to present a lower appearance to a high
SWR situation. For a lossless line, SWR is constant all along its
length (which means you would measure the same SWR anywhere between
the transmitter and the mismatched load).

>Any other suggestions or general observations about this setup and hopw
>I can improve the antenna setup?

I don't see any discussion of a tuner. You will eventually need one,
if you don't need it already.

>I also plan to learn NEC and simulate
>this setup (hope it is possible to do it with NEC).

This is ambitious and commendable. As I said, antennas being the last
frontier makes this the last chance of experimentation (other than
getting the hang of using your gear).

Dave, I said an excellent contribution on your part--few will do as much, here I just repeat what I have already said...

Nothing wrong with .pdf, except it is too large... and in the case of all graphic content--not text searchable... .lit just gets things a bit more right, the format is easier to read, and it provides "text to speech", it will read the book in audio for you--even the visually handicapped can "read" it... and it is all free to make and read... (well, you have to have MS Word access)

I have access to a scanner which, if the back rib is cut off a book, and pages freed, scan a whole thick book in minutes--I have hand scanned books on my home scanner, a high speed scsi HP, and it does take a bit of time and effort--I am sure you did the same with the book you are speaking of, and know well that task... on a fast computer, conversion of a page by fine reader is seconds... it really just depends on how good the scanned images are... much less than 5 secs a page for good quality--scanned images...

I was hoping the "bookworms" on Linux would have come up with a compatible reader for Linux for .lit--I haven't searched--but is an excellent format to just ignore for petty battles--however, MSs' rights on it may make this impossible...

However, there are other routes to take too, one is .html, all platforms can read it and there are ebook creation tools which create to this format (pics can still be .jpeg's)--and can be read with any browser, ms word, the freeware star office for linux, html editors, etc...

We live in the land of computers--no task is impossible--many roads all lead to the same destination(s)... a good broad picture of what is available is good to have... I am sure I have not been able to find all which is available... still got the eyes open...

The ONLY "fault" I was finding is the size... download time... storage on disk (forget floppies, fill up a zip disk, cdrom quick with books that size, etc)...

I did not intend for you to see my comments as a "slur", rather I respect your work and your contribution... and like I said on my first post here, THANKS!!!

I think "Linux Warrior" is accurate... even your post I respond to here seems to mention and reinforce your commitment to Linux... no big deal... the corp. I work for does work in both Windows/Linux, I don't have an option to ignore one or the other, I have no real problems with Windows XP, Microsoft finally started doing something right... I came from the

commandline prompt in UNIX, then to DOS... was shocked when Linux went
GUI... but got used to it quickly...

Nothing wrong with Linux Warriors... one of my best friends is a general in
the army...<grin> I just think of myself as living in a "neutral country"
(like Sweden) when it comes to religious and political commitments to an
OS...

Warmest regards,
John

Sorry, Hasan, you're absolutely right of course. I remember your Ham
Radio article very well.

What I should have said was "if you intend to use coax feed..."

It's also true that coax feed is not as easy as it looks, because of the
"hot feedline" problem. In many ways a small ground-mounted ATU is
better. Since the half-square is a monoband antenna, the ATU is "set and
forget" and it's very easy to get going as you say.

Well, not quite monoband... with different ATU settings, a 40m
half-square will also work as an end-fed half-wave "inverted U" for
short skip on 80m.

>I ran this antenna for

One end of the dipole is at about 4 ft above the terrace (which is 50
ft
from ground) and the other at about 6 ft from terrace.

> I don't see any discussion of a tuner. You will eventually need one,

I don't have a tuner yet. It's directly connected to an antenna.

Have you checked the SWR at different points in the bands? If you have what
differences have you measured. The antenna might just need tuned.. without
knowing how the difference between the top and bottom of the band it's hard
to say if anything else is affecting it.

resolves:

>What could be the possibl;e reasons for the high SWR I am seeing?

Hi Ramakrishnan,

The why of your question is simple: the antenna is not tuned to the
frequency you are applying. An alternative is that the set's built-in
SWR meter is hardly a precision instrument - another reason for an
external tuner (with a larger readable SWR meter).

But back to the antenna not being tuned. Again, this is the thrill of
"the last frontier." There are MANY variables that contribute to
tuning and it takes only one variable to be off, and so is the tune.
You should count it as great luck to have been so close to tune with
your first try.

Tune through all frequencies that are available to you, and build a
chart of SWR vs. Frequency. Then make a change in the antenna. This
can include
* changing the angle of the V
* changing the length of either leg of the V
* raising or lowering either/both leg(s) of the V
* raising or lowering the feedpoint of the V
and for each variation taking readings for new charts of SWR vs.
Frequency. Note the trends as they will reveal where your design
focus should be heading.

I would point out, however, that antennas intended for even harmonics
(40M/20M) usually portend disaster. I suggest you research the net
for "fan dipole." That you do not report any such disaster suggests
that due to what you DO report (unequal length dipole legs) suggests
that you have is what is called an OCF (off-center feed) dipole. This
makes yet another variable that tends to throw a spanner in the gears
of tuning. In this regard, you need to research the net for the topic
of "feedpoint choke" or "W2DU style BalUns."

Well, as you can see the discussion has barely warmed up and you have
the prospects of starting a journal dedicated to all the variations of
a simple design. One maxim to observe:
"No one ever builds ONE antenna."
You may as well get used to the idea that nothing is permanent, even

if you get it right. Plan on being flexible so that doing things repeatedly does not become a chore. If you note all the variations listed above, it should suggest that at a minimum you should invest in pulleys. ;-)

Message-ID: <NKfke.45950$vi2.1842103@twister.southeast.rr.com>
Source record: 76580

For A while now I have been pondering practical ways to build a 20 meter J antenna mostly for the grins and giggles of doing it. Recently I came by a couple of lengths of triangluklar tower. I was thinkinking about erecting these an placing a metal pole down the middle shorting the two together at about 16 ft from the top. The radiator would consist of a 30+ ft fiberglass whip. Any thoughts on this design would be appreciated. Other ideas for a J have been dismissed because they would require guys. I need something that would be freestanding.

Source record: 76581

Thanks Richard for the new frontiers!! :-) I am learning a lot.

Mine is a center fed dipole with a 1:1 balun which feeds both 40m and 20m dipoles. The ends are at unequal heights because I couldn't find a convenient way to tie the ends in the terrace.

My next experiment is to measure SWR at dofferent frequencies. To make things simple, is there some kind of input signal suggested? Shouting can easily come down afew decibels, after going up and down the stairs adjusting the dipole angle and lengths. :-) I don't have a CW key yet. :-(So what's the other option?

Hi Ian,

I thought you meant something like that, but I couldn't figure out how to say it, and thought it would be "cute" to make a little joke at your comments. Then I thought of "if you want to feed it with coax" way to state what you were saying, but that wouldn't work either, because the tapped coil is coax fed too. The real issue is how "easy" it is to direct feed with coax by using the corner feed...but it has a host of common mode issues that aren't that much easier to deal with than making the coil/cap combo in the first place. The only thing that maks the corner feed "easy" is doing it wrong and ignoring the common mode problems with routing of the feedline.

While I did write the article for HR mag, I must admit my only contribution to the "art" was the clever use of a piece of coax for a high voltage, easily tuned capacitor. If I hadn't hit on that solution, I would never have even tried the half-square, as the weather protection and availability of kw handling caps is a real issue.

I would encourage anyone wanting to do the half-square (a marvelous antenna) to consider a piece of coil stock and a few inches of coax for the feed point, in place of the corner feed. (Of course, this requires a VSWR bridge or Antenna Analyzer to adjust the tap on the coil, but it certainly isn't rocket science.) I used the 40m half-square for many years and it performed flawlessly and required zero maintenance in a harsh Iowa climate of wind, snow and ice.

The method I used for building it couldn't have been simpler. What I did was get out a long piece of stranded wire, slid two egg insulators on 33 feet, twisted the first insulator once or twice to anchor the insulator, slid the 2nd insulator 66 feet from the first, twisted it once or twice to anchor the 2nd insulator (now we have both corners), and then measured another 33 feet, and cut the wire.

The nice part about this is, no soldering at the corners, one continuous piece of wire and away ya go. I then pounded a ground rod in under the first corner, mounted the air dux coil/coax cap bottom directly to the rod and the bottom of the first vertical wire to the top of a plexiglas plate that held the coil. Just about as simple as one could get. All the strain is on the plexiglass.

I waterproofed the coax with a blob of clear silicon rubber....caution here....the antenna will stop working until the blob "cures", as it shorts out the open end of the coax (I chased this problem for a few hours until I realized that until cured, the silicon rubber is a short circuit.

This configuration lasted many years and required no attention. I did end up putting a plastic box over the coil to keep the snow/ice off the coil, but that's all it took. I've often thought of putting another one up here at the new qth, but I don't have trees in the right place like I did at the other qth.

Anywho, my comments were all in good fun. Your observations evoked a lot of pleasant memories from years ago about an antenna that was instructive and fun to build, not to mention a sterling performer on 40m.

p.s., yes I did run it on 80m as well, and I was surprised how well it worked, but then again, it becomes and end fed half-wave "bent" antenna. Two for the price of one, "sort of".

> What could be the possibl;e reasons for the high SWR I am seeing?

2:1 is NOT a high SWR and is tolerated well by most
transceivers. The reason that the SWR is not 1:1 is
that the feedpoint impedance of the antenna is
something other than 50 ohms.

> frequency you are applying.

There's no guarantee that a tuned antenna is going to have
a feedpoint impedance of 50 ohms. Between 0.1WL and 0.33WL
in height, the same resonant dipole can have a feedpoint
impedance variation between ~20 ohms and ~100 ohms. A resonant
dipole in free space will have an SWR of ~1.5:1 using RG-213.

The reason that the SWR for any antenna is not 1:1 is that
the load (the feedpoint impedance of the antenna) is not equal
to Z0 (the characteristic impedance) of the feedline.

You can generate a CW signal using FM mode and the mic
button if you guarantee absolutely no background noise,
i.e. absolutely no modulation. My SSB mic element failed
me one time and I got a CW message through without a CW
key by using the mic button in FM mode on my IC-706.
Please don't ask what my CW-WPM was. :-)

Depends on the inertial dampening of the meter needle.
If you can, use FM mode with zero modulation or simply
plug in a shorted audio plug to your CW key socket.

Probably the ratio of forward to reflected power in your antenna system does not change with the power applied to it. But many tx circuits that measure SWR must be manually calibrated for the forward power in the system in order for an ~ accurate indication of SWR.

The best accuracy is possible using CW output, after calibrating the SWR meter for that forward power level. As the average power during voice modulation usually is less than the rated average power capability of the tx, the varying SWR readings you see when voice modulating might all be lower than the true SWR of the antenna system.

So when are you going to stop talking and do it? Otherwise take what's available and stop whining and putting down other people choices (i.e. SHUT UP). 99% of us couldn't care less what your opinions are- as in "sharing them" - you've managed to insult and alienate many people here in a very short period of time. If that wasn't your intention - then I suggest you review your words and consider them from other's perspective. If it was your intention (as your overly broad slam against Mac users, seems to indicate -- and no , I'm NOT a Mac user)- then [plonk].

Not warmest regards - in fact with growing disdain...

HAARP kooks are always on-topic in AFA-B, they last about a long as
Hoagbots and zetadrones.

3185. Marine VHF whip performance on ham 2m ham bands?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-23 15:51:01 UTC
From: Jon Gauthier <jon.dot.gauthier@ieee.dot.org>
Message-ID: <d6su55$oe8$1@newslocal.mitre.org>
Source record: 76600

I haven't fired up EZNEC yet, but I was wondering how a standard 3dBi marine whip would perform on the 2m ham bands. Since the marine frequencies are 156.050-157.425 MHz, what could I expect at 144-148 MHz?

If it won't cut it, then does anyone have any recommendations for a dual-band antenna (commercial or home-built)?

Jon

Should be easy to research. Control tower personnel spending their working lives in that building with all the antennas transmitting in the 225 - 400MHz and 118-136MHz range should provide plenty of study material.

I've got reasonable bandwidth resources, so I've put up the 'printer'
version as a straight PDF download, for those who don't have bittorrent
available. <http://www.r-bonomi.com/radio/>

The server does impose limits on transfers --
it rate-limits that file to 16kbyte/second,
so the download will take almost an hour.
it will also allow no more than 4 simultaneous downloads.
It gives a polite error, if the session limit is reached

Enjoy!

Well, gee, I was so enjoying the fact you were out there reading my posts, what a disappointment now that you have went and dropped me in the old bit bucket...

And, gee, I did come here just to sit around and idolize everyone... guess my coarse nature prevents that--oh well, we all have to work with some kind of handicap--guess we will all survive...

Thanks for pointing out your opinion(s)--I will surely keep it/them in the back of my mind... perhaps at some future date it/they will be useful, no knowledge is without merit...

Don't attribute more to me than I am capable of though, can't really take the credit for "alienating" anyone--they all have free wills and do as they please--really, I don't have that much control over people--it is really their strengths and weaknesses which limit or raise them to the heights they find themselves standing at... thanks for being so flattering though... unless you meant I should suffer others "control freak" natures--then I must decline...

Since I have been in the exchange of text, here is this thread-all I have gotten is a list of won't work, shouldn't work, isn't supposed to work and might be illegal or offensive to "radio gods"-I don't work that way-indeed, if the purpose of this is to stop anything-it has exactly the opposite effect. I can tell from the lack of young and dynamic minds here that you have been successful, either by intention or not, at quelling all but conversations revolving around tried and true ideas and in the discussion and worship of ancient texts-which are obscure and difficult to obtain and hinder learning by those very facts. interesting way to "run a ship" but not very conductive to getting anything done. I think most tire of this and move on-leaving a bunch of grouchy old farts that wish to get back to worshiping some ancient ham/author that wrote a book/article a few decades ago. and not be bothered with having to think. not surprising that amateur radio reflects what is done/said here... and suffers for it.

While this may please some-it does not please me-one must ignore this all and move on. if you or any others need "ego stroking" perhaps there is already such a newsgroup thread, or, one could be created. I am almost positive you will find what you want there-certainly, if not, you will be left alone there--most likely with others of your ilk--perhaps this will generate a need to start up a mutual admiration society, and another newsgroup thread will spring to life.

Warmest regards,
John

Gene:

I have a mp3 CD (actually three--I just can't find anymore songs I wish to have) for my car player, there are almost 300 songs in mp3 format 112k bit rate... now each song stored in a "conventional manner" (wav format) would consume 40 megs each and just fitting 20 on a CD would be impossible--it is all what a person wants expects or is able to see the value of... at 3 megs each, many books will fit on one 650+ meg CD and be readable on almost every cdrom in the world... at 28+ to 33 megs few will fit and my collection of already unmanageable numbers of CDs will continue to grow at a speed which will bury me...

... how come everyone here thinks I want what they want--in most every case I have found I do not--surely others have noticed this... if I want something which can be purchased off a shelf, is what everyone else has--I'll simply go buy one!

... and how come the ones puzzled by this keep asking the same repetitive question(s), "Why do you want to do that?" If you know the reason do you think I will be any less likely to still want the answers I seek--if you do--your nature is not one of curiosity--it is for control--you wish to stop one from knowing/doing as they intend... don't be offended if others ignore this and move in the same directions anyway... I certainly am not offended by those who wish to stop or halt others--I realize they exist, have always existed--will continue to exist... I just don't care--and this is not those I seek...

Warmest regards,
John

>:-(So what's the other option?

Hi Ramakrishnan,

Give us some more details, like what rig you are using. There is a
chance that it has a "key" button for tune-up already. If you don't
have a CW key, I'm sure you have a screwdriver that would fit into the
jack (#2 Phillips maybe?).

So, as I understand it, you already have a "fan dipole." With uneven
length elements because of their tie-off, you could simply tie-off a
normal length element wire, and let the excess hang down. Take care
to select a tie-off point that is remote from surfaces (this may mean
that more wire hangs down, but this doesn't not seem to be an issue
with your height advantage).

Where in India are you located?

Hi Ramakrishnan,

This is why you need to do it with CW, and why you need an external meter/tuner. Building a meter is actually quite simple (although recent correspondence here would contest that statement).

SWR should not vary. It is dependant upon the mismatch of the transmitter to the load alone. When you get variations of SWR readings depending upon signal strength, the problem is often an issue of the meter, and then, secondarily, the transmitter's source resistance. This is why you should tune at the level you are going to transmit at. You can first get into the neighborhood with lower levels while tuning (although you lack a tuner) and then boost to the anticipated power for the last adjustment.

I think if you do research that... in recent years you will find that the concrete is now even made to provide much more shielding than in the past, as such facilities--right down to the window glass which is a super high metal content with frames providing ground straps... it has not escaped some that high levels of rf has effects on biological material...

...even high-intensity ovens have been expermentally constructed which are able to cook food with ultra and infra sound (there have been weapons developed around infra-sound)... no frequency is without properties we have overlooked--but no reason to stop talking--I don't even get warm when a bunch of people scream... <grin>

One guy who didn't like his neighbors in an apartment next door--in New York City, even removed the door to a microwave, constructed a "horn type" antenna to replace it with and beamed the microwaves into the apartment next to his (think it all started over a loud stereo) the neighbors noticed a decline in their health and interference with their electronics... pics and details of the device were available on the net, didn't look difficult to construct--they must still be there, somewhere...

Warmest regards,
John

I have enough of a problem expressing it even once.

Given that I am the consummate curmudgeon, you will have to ask someone who enjoys interfacing with humanity.

Aside to Cecil:

By the way, I located some relays finally and am back up and running. I picked up a 130 foot pre-made Van Gordon Eng (actual length 132 feet) $29.00 and another 100 foot of ladderline for $12.00. 7 relays and 2 digitran thumbwheel switches now covers me from DC to Daylight. All ham bands and Navy mars freqs. One antenna under $50.00 and worst swr is 1.4:1.

Many thanks for doing that, Robert! If your server keeps stats, could you let me know how many downloads it sees over the next few weeks? I admit to being curious.

FWIW, the BitTorrent tracker reports a total of 60 completed downloads so far - 21 of the smaller ebook version and 39 of the printer-optimized version. I find that to be a very satisfying response, for a day and a half of distribution of an admittedly obscure text... I'm glad so many people were interested.

I'll be leaving the BitTorrent tracker and seeders running for the forseeable future. HTTP access is certainly more convenient for most folks, and for handling sporadic occasional downloading. I may shift my home system over to doing both sorts of distribution at some point in the future, when I'm fairly sure that the rush is over.

I've been told that the gent who owns the Ham Radio Outlet dealership chain has a site located in the hills south of San Jose, and that it includes a 3-element 80-meter rotatable beam. I was told that the whole setup is managed by remote control - the owner lives elsewhere, and accesses the transceivers and antenna controls via a landline connection of some sort.

Haven't seen it myself... it would certainly be impressive!

Anybody seen that massive antenna farm, just off I95, on the north west
side of Trenton NJ? Often wondered what it was.

73,

Frank

3203. Vincent antenna

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-23 19:27:05 UTC
From: Allen Windhorn <Allen.Windhorn@LSUSA.com>
Message-ID: <ubr71n3p2.fsf@LSUSA.com>
Source record: 76618

There was a report in the Electronic Engineering Times (16 May 05)
about this antenna, which is a helical with extra top-loading and an
optional capacitive hat. Designer was Rob Vincent (call?) at the
University of Rhode Island. More info at:
http://www.uri.edu/news/releases/index.php?id=3126
and a presentation at:
http://www.uri.edu/news/vincent/boxboro_files/frame.htm

Anyone seen this particular combination? Appears to have very good
performance.

Regards,
Allen WA0OHE

>admit to being curious.

Of *course* it keeps stats. What fun would it be otherwise? <grin>

In the 2-1/2 hours since I posted the notice, I've had 7 full downloads,
and a couple of aborted ones.

And one guy _did_ get turned away for a bit, because there were already
4 downloads running. :)

Drop me an email to remind me, when you want to see the numbers.

Note: I've got a psychic mail-server. The address on the postings _is_
valid, but it accepts mail *only* from inside a newsreader, in reply
to an article I posted. Amazingly effective at eliminating 'spam'. :)
The reject notice does provide a work-around, for those who need it, too.

Hi Allan,

Alas, yes, and nothing seems to have improved over the months - same
spelling errors, lax reporting, sloppy presentation, and a smattering
of conflicting claims:
"Vincenti¿½s Plano Spiral Top Hat antenna at 7 megahertz is half the
size of a normal quarter-wave antenna operating at that frequency.
:Note it says half the size, later this will be changed
The URI antenna gain matched the performance of the ideal
quarter-wave antenna, and its bandwidth was nearly twice as wide.
:as usual, no specifics offered, later this "twice" will be changed.
...
"In addition, the gain of Vincenti¿½s capacity Top Hat DLM antenna,
:in addition to WHAT?
which incorporates a helix, a load coil, a capacitive top hat
:it incorporates 3 items? or 2? Is the helix the coil? More change follows.
utilizing radial spokes at the top of the antenna and a horizontal
plane was nearly identical to the ideal quarter wave antenna. Its
bandwidth was greater than 5 percent of the operating frequency
:not twice the bandwidth anymore (and not even close to standard BW)
and the antenna is more than 70 percent shorter than an ideal
quarter wave antenna.
:not half size - 30% size, but this changes again.

"Vincenti¿½s standard DLM antennas with a standard helix and load
coil were also tested at various frequencies. All exhibited gains
:it incorporates 2 items? Standard helix is the former coil above?
nearly equal to the ideal antenna with bandwidths of 3 to 10
:well, what exactly is being compared to here? Ideal is 3? or is it 10?
percent. The antennas were 33 to 40 percent shorter."
:now we are LARGER than half size

Let's see, we have a 30%, half size, 67% tall radiator with 3 (make
that 2) loads that matches (nearly) the gain performance of a standard
antenna exhibiting somewhere between 3% and 10% bandwidth.

I note that the link (sic, the poor html authoring makes this simply a
text inclusion) to the Navy test site is NOT to the Navy Test Report,
but simply to the Navy test site (even the cfa web pages can produce a
link like that).

Tedious puffery at best.

'SWR meters' don't measure SWR directly. They sample the forward and reflected signals, both of which vary during SSB voice modulation -- even when the ratio between them (SWR) remains constant.

A variation in forward & reflected readings during SSB modulation is a normal situation, and not necessarily traceable to the SWR meter, the tx source Z, a varying antenna system Z, or anything else.

Source record: 76624

Why use a J at all? I'd just use a 1/2 wave radiator,
and feed it using a gamma loop setup. ,For 20m,
a 20 inch single turn loop should work ok. Can be
made from copper, or aluminum tubing. If you need
a capacitor, it can be made from coax. For 20m, about
100-140 pf should be pretty close... BTW.. this design
would be the same as any VHF ringo...MK

The presentation at the URI website has a lot more details --
apparently a number of antennas have been tested in various
configurations. (It still has spelling errors!)

The helix is the main part of the antenna, with a (maybe optional)
loading coil above that, then an optional straight section or top-hat,
which may or may not be spiral-wound to act as additional loading
coil. Reminds me of the "discpole" antenna in that it tries to get
uniform current in the radiating section.

Maybe I'll to build one to try it out.

NIF SUPERLASER BEAM WEAPON -- LASER
HAARP WEAPON -- MASER

IT IS QUITE COMMON TO HIDE BILLION DOLLAR BLACK OPS PROJECTS SUCH AS THIS ONE [NIF] AND HAARP AND MKULTRA.

Laser Could Rival Energy From Sun's Center By H. JOSEF HEBERT, Associated Press Writer
Sat May 21, 4:20 PM ET

Ed Moses talks of the "grand challenge" that has consumed him for the past five years, comparing it to trying to hit the strike zone with a baseball from 350 miles away or tossing a dime into a parking meter from 40 miles. "That's the precision we have to have," says Moses, the director of a high-energy physics adventure to produce the world's most powerful laser - one that scientists hope will create in a laboratory the energy found at the center of the sun.

In a building the size of a football stadium, engineers have assembled the framework for a network of 192 laser beams, each traveling 1,000 feet to converge simultaneously on a target the size of a pencil eraser.

The trip will take one-thousandth of a second during which the light's energy is amplified many billions of times to create a brief laser pulse 1,000 times the electric generating power of the United States.

The goal is to create unimaginable heat - 180 million degrees Farenheit - and intense pressure from all directions on a BB-size hydrogen fuel pellet, compressing it to one-thirtieth of its size.

The result, the scientists hope, will be a fusing of atoms so that more energy is released than is generated by the laser beams, something scientists call fusion ignition. It is what happens when a hydrogen bomb explodes.

Four of the beams have been tested. When completed in 2008, the National Ignition Facility, or NIF, as the laser at the Lawrence Livermore National Laboratories is called, will dwarf many times over any laser to date.

It will provide a platform for many experiments in high-energy and high-density physics, from learning more about the planets and stars to advancing the elusive hunt for fusion energy to generate electric power, Moses says.

"You have to think of this like the Hubble," he says, referring to the space telescope. "It's a place where you will see things and do things that you couldn't do anywhere else."

The government is investing $3.5 billion, and possibly several billion dollars more, in NIF for another reason: national security.

If NIF achieves fusion ignition, it will for the first time in a laboratory simulate the pressures and heat of a nuclear explosion, allowing nuclear weapons scientists to study the performance and readiness of the country's aging nuclear arsenal without actually detonating a nuclear device.

Underground nuclear testing in the Nevada desert ended in 1992.

The NIF laser "is essential to assessing the potential performance of nuclear weapons," says Energy Secretary Samuel Bodman. He says the experiments will help determine the effects of aging on warheads and help assure they will work as expected, should they be needed.

There have been other lasers, including a 10-beam Livermore project called Nova. NIF will produce 40 times to 60 times more energy. "It's the difference between a car and a jet engine," Moses says.

For many supporters the "pass-fail" is whether the NIF lasers will achieve fusion ignition.

"We never intended to spend $5 billion to $6 billion to build a laser facility for ... civilian research," Sen. Pete Domenici (news, bio, voting record), R-N.M., chairman of the Senate subcommittee that funds the NIF program, lectured an Energy Department scientist last year when he learned fusion ignition experiments might be postponed.

Energy Department officials now say the project remains on schedule with the first fusion ignition tests planned for 2010. Domenici remains skeptical.

"It's a terrible expense and a drain" on other programs to maintain the nuclear arsenal, Domenici said in an interview. "They're going to have to prove they can get the job done."

Among some people, fusion ignition "has become the poster child for NIF being successful" and that shouldn't be the case, counters George Miller, a former nuclear weapons designer and bomb tester who heads the project. He says there are many other experiments for which NIF will be valuable to nuclear weapons scientists.

"We are conscious of the importance of ignition" and "there's no reason to think we're not going to get it," Linton Brooks, head of the federal National Nuclear Security Administration that oversees the country's nuclear weapons arsenal, said in an interview.

But at a recent Senate hearing, Brooks said a 14 percent budget cutback in the fusion ignition program creates "additional risks" that fusion ignition may not be achieved in the 2010 timeframe.

The NIF program has had a decade of turbulent history marked by exhilarating successes and embarrassing setbacks, large cost overruns and charges by some critics that the project was oversold from the beginning to win initial support in Congress.

When the idea of a new, super laser first emerged in the early 1990s, the cost was put at less than $700 million. By the time construction began in 1997, the price had grown to $2.1 billion with completion by 2004; three years later it ballooned to $3.3 billion and the completion date delayed four years. Critics contend the price is now up to $5 billion when associated expenses such as developing a target capsule capable of achieving fusion ignition are included.

"If Congress knew it would cost $5 billion up front, would they ever have funded it? No way," maintains Christopher Paine, who has monitored NIF's development for the Natural Resources Defense Council, an environment advocacy group, and has been one of its sharpest critics.

Despite its price escalation and remaining uncertainties, NIF maintains strong support in both Congress and the Bush administration. However, there have been other high-energy physics projects on which billions of dollars have been spent only to be dumped.

Congress pulled the plug in 1993 on the Superconducting Super Collider project, a racetrack-like device in Texas to study elementary particles and forces, after spending $2 billion. The Clinch River Breeder Reactor project in Tennessee was canceled a decade earlier after $1.7 billion had been spent as the United States abandoned nuclear fuel reprocessing. Both projects had large cost overruns.

Paine, who in a critique once dubbed NIF "The Unlovable Laser," maintains that NIF should follow the same path. He says it isn't needed and poses a nuclear proliferation risk because it might make it easier in decades ahead to develop new nuclear weapons, not just maintain existing ones.

The JASONs, a group of scientists frequently called upon to review complex defense or national security issues, has concluded that NIF "does not represent a significant proliferation risk" and is "fully compatible" with U.S. nonproliferation goals.

Still, a recent report by the Defense Science Board, which advises the Pentagon, urged more openness about NIF activities and a mix of civilian and defense NIF experiments to ease any public concerns about the laser's purpose.

The question of openness has been an issue before.

The program's critics charge that Livermore officials lowballed NIF's capabilities and potential cost from the beginning. When Congress was sold on NIF's importance because of its ability to simulate a nuclear explosion, scientists were at best only half certain fusion ignition

could be accomplished, NIF program supporters acknowledge today.

Three years after NIF construction began, congressional auditors concluded in a 2000 report, "Congress cannot know with assurance just how much NIF will cost ... what impact NIF will have on the overall nuclear weapons program, or how long it will take to complete."

That report and others were prompted by discovery in late 1999 that engineers had encountered a serious problem installing the laser's optics and had hidden it from senior Energy Department officials and Congress.

In short, they could not keep the optics free of dust. To fix the problem would add $350 million to the project's cost. Even as engineers scrambled to try to find a solution, Livermore officials were telling then-Energy Secretary Bill Richardson that the program was on schedule and within budget.

"I remember being shell-shocked," Richardson said in an interview. "I had just been at the facility the month before and I had been briefed and pronounced (the laser program) in sound shape, a vision for the future."

It didn't help that NIF's project director also had just resigned after it was discovered he never completed work on a doctoral thesis and that a string of outside reviewers failed to identify any shortcomings with the project.

"The problem was, we had people doing this that did not appreciate the scale of what they were attempting to do," says Moses, a laser engineer and longtime senior manager at Livermore, who was brought in to lead the NIF program in late 1999. Those who had the vision of NIF found it was more complicated when it came to actually building it, he said.

The new team tackled a variety of problems.

By 2003, the dust issue was solved by building a massive clean room and installing the optics in modular dust-free units. Engineers found new ways to produce the thousands of highly polished pieces of laser glass. A faster way was found to grow high-quality crystals that convert the beams to ultraviolet just before they strike the target.

And with four of the planned 192 beams operating, new tests suggested strongly that when the system was fully operating, enough energy would be produced to - theoretically, at least - achieve ignition.

Last year, however, a new complication emerged - not over the laser but the pea-size pellet that contains the hydrogen fuel that will be ignited by the lasers to achieve fusion ignition. Could the pellet be manufactured to the required specifications?

Once its shell was to be made of plastic, but that idea was abandoned. Now the choice is beryllium, a metallic element that can withstand intense heat, is molecularly stable and is a good conductor.

It still is uncertain whether beryllium can be machined to
specification, according to technicians who have monitored the program.
Last year Congress directed another outside review to report how the
development of a beryllium target might affect NIF's timetable.

Like previous challenges in the project's history, the beryllium issue
will be resolved, Miller and Moses believe.

While the massive laser may one day have a broad range of scientific
uses - some not even envisioned by today's scientists - the
immediate focus remains assuring the reliability of the nation's
nuclear arsenal without actually testing the weapons.

"It gives us confidence that the nuclear stockpile stewardship approach
will work," Miller says.

I came across this web site (http://k9erg.tripod.com/theory.htm) and he says that if properly matched, you could load up a paperclip on 160 meters and it would work. I'm not so certain, since this thing should be so full of capacitive reactance that the losses in the matching network should be astronomical.

Any thoughts?

yup, Dave is right

You might want to buy/make a small 2m antenna tuner to match it up a bit if
you seek a near perfect 1:1 match.

Hi Allen,

Same old stuff. What I chose to criticize specifically did not mean I
was unaware of other problems of reporting and presentation. Given
the increased general incidence of spelling problems, some use that to
"prove" their passion as a substitute for their showing accuracy.
Without stigmata, it isn't so compelling.

>Maybe I'll to build one to try it out.

When the world is clamoring for fractals, ehs, cfas, and lattins? Oh
well, ANY one of these built successfully (according to claim) would
be a first for the record book.

Jimmie:

A half-wave radiator (the J is such) is an excellent ant and it can be run without ground plane...

However, the J with the added bulk of the quarter-wave matching section makes no sense, when a gamma match can be used with a slight gain in efficiency... I worked out such a design and use it on 10 meters... a 1:1 current balun at the ant is necessary, or ferrite beads over the shield of the coax--I found an inductive reactance of the balun/beads of about 2000 ohms at the operating freq is ideal and halts all line currents.... the lenght of the gamma rod will be approx. 1/3 longer when used on a 1/2 wave then when used on a 1/4.... I use no counterpoise, but a 1/4 lenght of wire can be hooked at ground and the ant worked against it... I find it unnecessary with the balun and ant properly tuned and matched...

You will not see this ant on the web... take my word for it, it is a decent antenna... better yet, try it, if you are unhappy, just remove the gamma and stick on the 1/4 wave matching section and you have the J...

Warmest regards,
John

He only said it would radiate all the power fed to it. Unless well shielded
the matching would radiate much more power than the paper clip. Also it
would probably loose about
99 & 44/100 % of the power in the matching network. Also should need a
good ground system :-)

Well, I said that wrong, I figure the length of the gamma rod will run right around 6 ft for 20 meters, this should get you close enough to tune from, the cap reactance needed in series with the rod will need to be of a value to cancel that of the inductive reactance intoduced by the gamma rod... I think that is clearer...

Warmest regards,
John

I did use a fractal layout for the relays. That may be the reason for sucess
:>)

I put together a tuning chart of calculated values. After installing the
antenna at 35 feet in the center and 20 feet on the ends. The actuals layed
almost exactly on the calculated.

Using 1,2,4,8,10,20, and 40 feet I can read the additional footage directly
off the digitran switches. I like it better than the 1 to 16 I had before.

I added the longer pieces to be able to operate 60 meters as well as the
Navy Mars Freqs.

Next I will replace the switches with a basic stamp that will get the
frequency off of my Icom compute the proper length and select the relays to
get that length.

At last an all band no tune, no switch antenna. QSY and always be where it
should be.

I was 5-7 into Scotland the other night on 3.990 running 100 watts. Not bad
for what is essentially a NVIS antenna.

For all those out there named Thomas, it works as advertised, try it you
will like it!

Odd, and interesting! I had a similar report from someone else last night.

On the other hand, I just went to the link myself, fetched the torrent file, and my BitTorrent reference client launched itself and started a download of the -ebook version with no problems at all.

What client are you using? Are you behind some sort of NAT gateway or other firewall?

The tracker shows me three downloads in progress - my own (of the -ebook) and two others (of the -printer). I'm getting about half of the download bandwidth, though, so it may be that one of the transfers is stalled for some reason.

It's a play on words. If you cannot get the power into
the paper clip, it is not "properly matched". Ergo, a
it is impossible to "properly match" a paper clip on 160m.

Tam was kind enough to send me his EZNEC file. I asked for this file
since I went through this myself unsuccessfully (so far) and wanted to
see if someone else had a better idea.

My suspicions were confirmed: there are some NEC guideline violations.
I'm don't want this to come off as picking on Tam publicly, but to
keep others from making the same mistakes, (*I* would never make a
mistake [g]) here's what I see.

Tam uses a single wire at the middle of the dipole to contain the
source. This is necessary because NEC doesn't allow a source at a
wire junction. (EZNEC has a split source that works at a wire
junction, but not a multiple wire junction.)

The EZNEC manual recommends that this wire be at least 0.02
wavelengths long and consist of three segments. I believe the three
segment rule is stipulated to force the segments adjacent to the
source wire to be equal to it. If we are careful about this, we can
go to one segment.

Tam's center wire is only 0.2 feet long and has 11 segments. The segment length of .018 feet is way too short; the wire needs to be ~16' long at 3.5 MHz to meet the guidelines.

Of course with this gross violation comes another one when the connecting wires are a more appropriate segment length.

Tam, I suggest that you got to Options-->Segmentation Check and make it "Auto".

I'm still looking at this issue and will report back if I see any progress.

Hi Richard,

I am using Icom IC-706 (not the newer one, but the oldest one), got it from another local ham for a good price. I am using an external SWR meter, of a friend. (Lafayete is the brand name I can read in the box).

I am located in Bangalore, a city located in the southern part of India.

I found from the manual that I can do CW with the Icom supplied mic.
Wanted to try it yesterday evening, but because of heavy wind and rain,
there was (is still) no power for the whole of yesterday night untill
now. Hopefully today evening I will try it out.

I am scared about transmitting, as costly stuff like a transceiver can
be difficult to get repaired in India. Sending it abroad for repair
costs as much as I would pay for a new transceiver!

I'm surprised that no one has mentioned the Wullenweber's (AN/FLR-9)
that were used for radio survellence and direction-finding years ago.
They may not have been the largest, but they were certainly among the
most complex.

Yes it was. I heard their two meter signal using a HB 7 element Yagi
with the reflector about a foor off the ground and the boom propped up
on a ladder.

W5UN's EME array is "Mighty Big" too. I've worked him on two meter
EME 2XSSB when my antenna was on;y four 3.2 lambda Yagis.

http://web.wt.net/~w5un/mba2003.jpg

I don't have the links but some of the OH hams have some really large
stacked h-f arrays.

Yes, nothing remarkable about the power level in the TV universe. The
similarly powered sites I was referring to are devices of a similar
nature ie ionosonde or other similar ionospheric research gadgetry.
But to the uninitiated, it probably sounds like a lot.
But IF they want REALLY BIG SCARY numbers they should do some arithmetic
on the amount of solar flux hitting the upper levels of the atmosphere
every second of the day and night.....

Well, suppose that it "could" be done.
Take a large paperclip and stretch it
out to its full 4-inch length and note
its 0.05-inch diameter. Too lazy to
dig out my Kraus or Jasik, I plug those
numbers into EZNEC (it complaining loudly
all the while about minimum segment
length) and come up with a radiation
resistance of 0.0001818 ohms when feeding
the stretched-out paperclip as a monopole
against a perfect ground on 1.9 MHz.

Now, I want to run my 1500-watt ham rig
into the paperclip and get efficient
radiation. To do this requires that I
pass 2872 amps of RF current into the
base of the 0.05-inch diameter paperclip.

I think I see a problem here.....

DOUGLAS SNOWDEN wrote:
>If you were to use aluminum for the verticals rather than wire, what
>would the shortening factor be?
>

If it is end-fed, as Hasan recommends [*] then the exact height of the vertical parts wouldn't matter much.

The main difference would be in the high-angle radiation from the horizontal part. That radiation is roughly canceled, but in a half-square the cancellation is never complete... which means any differences would be very hard to hear.

But be aware that the voltage at the bottom of the far end is very high indeed. This is no place to use a metal ground post and a thin sleeve of plastic pipe! I've drilled holes through thick PVC support blocks by voltage-feeding a half-wave vertical, and this open end is worse.

Several times. The old 400MHz feed would work at 432, so on days when the moon was at the right elevation in the sky, they had maybe 20 minutes operating time as it passed directly over the dish.

The last time this happened was about 20 years ago, and I was lucky enough to make a QSO. Lucky, because I almost tuned right past him, thinking "That's too strong to be a moonbounce signal."

I was running a kW and 8 yagis. The QSL card said he was running 10W... and Arecibo.

Hi Ramakrishnan,

This rig is sure feature loaded. If you don't have the manual, visit:
http://www.icomamerica.com/support/manuals/ic-706mkiig.pdf
As I suspected, a #2 Phillips will do the job of key-down. I didn't
take the time to wade through the manual - my taste in gear runs
towards surface mount meaning a single component that can be held
between two fingers, and the markings can still be read without heavy
lensing.

I presume you don't have the optional tuner, otherwise we wouldn't be
talking about SWR.

The external SWR meter is good enough (does it agree with the ICOM
front panel indicator?). Do you have a dummy load to test it against?
If so, we can proceed along those lines too.

Hi Ramakrishnan,

And especially for such a small form factor. Most of the reviews I've seen have been quite positive. The few negatives were about software. However, I would point out that in regard to my last maxim about you never building just one antenna; you never own just one rig. Get a "beater" that you can get a soldering iron into without melting the front panel at the same time. Maybe even one with (gasp) tubes. The Ruskis are still building tubes, it seems, so at least surface shipping shouldn't cost as much there.

Also, invest in a decent battery (car battery size) using your power supply as a float charger. Then you can even out the power shortages. In this case, however, a tube rig may be stretching the limits of a battery. In that case, think of 20-25 year old transistor rigs (where the ICs are TTL only). This stuff is easily field serviceable (I know, because I've raised several from the dead).

This is all part of the "flexibility" you should plan on, as I also mentioned before.

Yes, I got the user manual and the service manual from this link:

http://www.qsl.net/icom/manuals.html

> I presume you don't have the optional tuner, otherwise we wouldn't be
> talking about SWR.

Yes, I do not have a tuner.

> The external SWR meter is good enough (does it agree with the ICOM
> front panel indicator?). Do you have a dummy load to test it
against?

Yes, it agrees. I don't have a dummy load. From what I read in this
group and elsewhere, I think a dummy load is the first test gear I
should get. It will definitely show whether the coax is faulty or the
antenna.

> Your weblog has crashed by the way.

Oh.. thanks. Will fix it this evening.

Ok. Thanks for all the suggestions. So, now I have to do quite a lot of
work to get back on air with a "decent SWR".

Hi Ramakrishnan,

Coax is not something that goes wrong with subtle error. Simple
continuity testing is quite often enough. However, a good load still
resolves full power issues.

Given the low power setting available from your rig, a corresponding
low power load can be built without too much trouble. If you have a
suitable multimeter, you can even extend the range of your SWR meter
to do low level measurements. Crack open that Lafayette (it has to be
a good 30 years old) and see how simple things can be. Identify the
RF section, as distinct from the DC conversion that drives the meter.
You will notice there are not too many parts involved and getting to
know what they are for will give you the momentum to take on the low
power challenge.

A tuner is no more difficult than a similar box with a gozinta and a
comesoutta, a multipole switch for a coil you wind, and a couple of
variable caps stolen from an old radio.

This, again, goes to flexibility. In this regard, knowing where an
old parts outlet is like having a treasure house. Not sure what
options you have in that regard in Bangalore.

Hi Ramakrishnan,

Well, in fact, you are not in a bad position even when you see 2:1.
There are no brick walls in this game, and the rig will take care of
itself if you try to do something wrong. It has what is called an
automatic "fold-back" circuit that simply refuses to put too much
power into a mismatched load.

Most fold-back circuits start to kick in -gradually- at 2:1. They get
more aggressive as the mismatch climbs.

The point of this protection is to reduce the heat burden to the final
transistors when the power it is trying to deliver just won't go there
(this is called reflection from the load). The fold-back circuit
allows the transmitter to run in a reduced capacity that idles along
at that tolerable heat level.

For example:

You are trying to drive 100W into a matched load. The finals don't
want to live under any more than their existing heating of 60 to 80 or
more Watts (this is power that will NEVER get to the antenna anyway as
efficiency is not remarkably high for HF voice). In fact, after some
minutes your fan will engage to keep the temperature at a safe level.
The net result is that you radiate 100W and waste that 60+ Watts of
heat. This CAN become a problem if your environment is already hot -
if you review the specifications for rated power out, I am sure they
describe the environment as being 20 to 25 degrees C. Hotter
environments demand "de-rating" the allowable limits.

So, in a sense, what is being maintained is an equilibrium of the
maximum tolerable heat burden at the final transistors (there are also
side issues of frequency stability that are heat related, but these
issues are not destructive). So let's press the envelope with two
strained examples:

1. You are trying to drive 100W into a 2:1 mismatch. The finals are
still under the same burden of 60+ Watts of heat to generate that
drive, but the load refuses to accept all 100W and puts an additional
heat burden (the reflection coefficient) back upon the finals to the
tune of about 12%. Hence that original heat burden, plus this

mismatch, boosts temperatures to 72+ Watts. The fold-back senses the returned power (this circuit is what is driving your SWR meter by the way) and it drops the excitation level so that the 100W is depressed to say 80W instead. The heat burden of inefficiency for 80W is cooler, but with the reflected heat burden now around 8 - 10 Watts the fold-back has juggled the books to maximize your power out, while holding roughly the same heat level. In reality, no one notices (unless you discover the fan is running longer now).

2. You are trying to drive 100W into a 5:1 mismatch. With this mismatch, roughly half the power you are trying to transmit is being reflected back to add heat to your finals. The fold-back is likely to be quite aggressive about how much real power you can expect to make it to this poor load.

Now, there are two forms of heat. The slow kind, like a clothes iron, and the quick kind, like a lightning stroke. The fold-back circuit is incapable of distinguishing the two, and the 5:1 scenario, with the wrong phase angle (reactive instead of a simple resistive mismatch) can lead to a voltage breakdown (the lightning heat) or catastrophic thermal runaway. Hence, you may find that at such levels (5:1) that the fold-back is complete instead of partial. Hopefully the fold-back is faster than catastrophe.

Still and all, it doesn't pay to push the limits when the load is known to be seriously out of whack. There is no indication of this in your reports of SWR.

So standard advice, conventional wisdom, and law converge with: always reduce power to a level consistent with reliable communication.

Richard,

Probably I missed telling the list that, the coax feeds a 1:1 balun
which is connected to the dipole. The dipole is center-fed, and balun
feeds both both 20m and 40m wires of the dipole.

I'm currently trying to work out if the explosion was a Good Thing or a Bad Thing. Explosions involving much shouting and throwing of household objects are usually a Bad Thing (an effective trigger for this type of explosion includes giving the wrong answer when asked "does my bum look big in this?"). The other type of explosion - the Good Thing - would surely cause women to donate funds heavily into your research program?

The antenna you are referring to should be spelled Wollenweber, which in German means literally a "wool weaver". They got that name because of their resemblance to an automatic sock making machine.

There were several of those stationed at strategic places around the world - mostly surrounding the USSR, and they were used by our people for the purpose of eavesdropping on Iron Curtain communications. I had some familiarity with the project in 1984-5 working for RCA Service Company. The project was called Maroon Archer and had been around for some time already. For example, there was one near Stuttgart. I'm sure they have been dismantled by now.

No No No -- it is 73s as you are sending best wishes to all that replied
(;-)

Just kiddin -- it is indeed just 73

But try convincing about half of the 680,000 USA Hams who always use 73s or
seventy thirds.
Just think you could become famous as the 73 person, correcting every QSO,
NG, and forum everywhere.

Incidently you all might want to read where 73 really came from and it has
nothing to do with the Winchester 73 rifle (;-)

See URL:
http://ac6v.com/73.htm#73

Then to really stir the pot -- is it "seven three" or "seventy three" ???
(;-(
Or does anyone care?

Send it in CW and ya can't go wrong (;-)

--��� ���--
CL -- I doubt, therefore I might be !

3268. I want to ask you the most important question of your life. The question is: Are you saved? It is not a question of how good you are, nor if you are a church member, but are you saved? Are you sure you will go to Heaven when you die? The reason some people don't know for sure if they are going to Heaven when they die is because they just don't know. The good news is that you can know for sure you are going to Heaven. May 24, 2005 11:34:43 am

THE MOST IMPORTANT QUESTION OF YOUR LIFE

This is the most important question of your life.

The question is: Are you saved?

It is not a question of how good you are, nor if you are a church member, but are you saved?

Are you sure you will go to Heaven when you die?

The reason some people don't know for sure if they are going to Heaven when they die is because they just don't know.

The good news is that you can know for sure that you are going to Heaven.

The Holy Bible describes Heaven as a beautiful place with no death, sorrow, sickness or pain.

God tells us in the Holy Bible how simple it is to be saved so that we can live forever with Him in Heaven.

"For if you confess with your mouth Jesus is Lord and believe in your heart that God raised Him from the dead, you will be saved." (Romans 10:9)

Over 2000 years ago God came from Heaven to earth in the person of Jesus Christ to shed His blood and die on a cross to pay our sin debt in full.

Jesus Christ was born in Israel supernaturally to a virgin Jewish woman named Mary and lived a sinless life for thirty-three years.

At the age of thirty-three Jesus was scourged and had a crown of thorns pressed onto His head then Jesus was crucified.

Three days after Jesus died on a cross and was placed
in a grave He rose from the dead as He said would
happen before He died.

If someone tells you that they are going to die
and then three days later come back to life and it
actually happens then this person must be the real deal.

Jesus Christ is the only person that ever lived a
perfect sinless life.

This is why Jesus is able to cover our sins(misdeeds)
with His own blood because Jesus is sinless.

The Holy Bible says, "In Him(Jesus) we have redemption
through His blood, the forgiveness of sins..."
(Ephesians 1:7)

If you would like God to forgive you of your past,
present and future sins just ask Jesus Christ to be
your Lord and Saviour.

It doesn't matter how old you are or how many bad
things that you have done in your life including
lying and stealing all the way up to murder.

Just pray the prayer below with your mouth and mean it
from your heart and God will hear you and save you.

Dear Jesus Christ, I want to be saved so that I can
have a home in Heaven with You when I die. I agree
with You that I am a sinner. I believe that You love
me and want to save me. I believe that You bled and
died on the cross to pay the penalty for my sins and
that You rose from the dead. Please forgive my sins
and come into my heart and be my Lord and Saviour.
Thanks Lord Jesus Christ for forgiving me and saving
me through Your merciful grace. Amen.

Welcome to the family of God if you just allowed God
to save you.

Now you are a real Christian and you can know for sure
that you will live in Heaven forever when this life
comes to an end.

As a child of God we are to avoid sin(wrongdoing), but
if you do sin the Holy Bible says, "My dear children,
I write this to you so that you will not sin. But if
anybody does sin, we have one who speaks to the Father
in our defense Jesus Christ, the Righteous One."

Those of you that have not yet decided to place your
trust in the Lord Jesus Christ may never get another
chance to do so because you do not know when you will die.

Jesus said, "I am the way, the truth and the life: no one
can come to the Father(God)(in Heaven), but by me."
(John 14:6)

This means that if you die without trusting in Jesus Christ
as your Lord and Saviour you will die in your sins and be
forever separated from the love of God in a place called Hell.

The Holy Bible descibes Hell as a place of eternal
torment, suffering, pain and agony for all those who
have rejected Jesus Christ.

The good news is that you can avoid Hell by allowing
Jesus Christ to save you today. Only then will you
have true peace in your life knowing that no matter
what happens you are on your way to Heaven.

Praise the Lord!
Servant of the Lord Jesus Christ

Wes,
Thanks for pointing it out. I did this in a hurry, and did not notice the 11
segments in the .2 ft wire. I will take a look to see if it is any different

for 1 segment. In fact, I might make it +/- 1 foot long.

Hi Ramakrishnan,

If, by this description, you mean that there are four wires, two for
20M and 2 for 40M; then that is all good and well.

However, if you mean that there are two wires, one for 20M and one for
40M arranged as a dipole; then that is unbalanced and what I called an
OCF Dipole.

By your description of a slight mismatch, I will take it that you are
using four wires - a Fan Dipole. This convention is widely used and
suited to your purposes.

I doubt it. I'm sure what Jesus said was in Hebrew because he was
Jewish. I can't stand Christians who claim that their bible translation
is the only correct one. Check out Jack Chick, the notorious
Cathlophobic who claims that the only true bible is the KJV version!
It's people like Jack Chick that gives Christianity a bad name.

If you want to go way up the spectrum, the Hale Telescope
http://www.astro.caltech.edu/palomarnew/images/cutaway.jpg
on Mount Wilson is a single-unit steerable antenna of sorts. Also may have
the honor of being the best-illustrated project. Russell Porter was an
artist with a drafting board.

3280. Off-Center-Fed horizontal wire with capacitive loading

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-24 18:01:59 UTC
From: Chuck Olson <chuckolson01@REMOVETHIScomcast.net>
Message-ID: <EqqdnTl9Pt0e8Q7fRVn-pA@comcast.com>
Source record: 76545

I want to put up the best antenna within the constraints of my lot size and building locations. I would also like it to work on 80 to 10 meters, including the WARC and 60 meter frequencies. I can put up a north/south leg 57 ft long and an east/west leg 63 ft long from a 28 ft steel TV mast at the southeast corner of my lot. I visualize tuning it through a 20 ft ladder line feeder using an ATU such as the SG-239 and perhaps a 4:1 current balun.

One objective is to locate all high-current sections of the antenna in the clear (contrast that to the G5RV which, for example, at 3.5 MHz folds the center 32 ft of high current wire of the 80 meter version into the feed line - - am I wrong?) To that end, I propose locating capacitive disks - - just a few 3 ft radials and a circumferential ring, mounted on Delrin standoffs from PVC masts at each end of the antenna to move the high current regions out away from the feed point on each leg.

I thought of using a couple of relays to modify the feed to selectively drive just the end of each leg or off-center feed both, as a form of transmission diversity, but that would require I add some hardware-cloth ground-cover under each leg for a counterpoise.

My questions: A) is there any undesirable effect of using capacitive loading on a horizontal wire? I Googled for similar ideas and couldn't find any use of capacitive loading on horizontal wire - - just capacitive hats on vertical antennas. B) What directivity can I expect from the 90 degree angle between legs?

Thanks,

Chuck W6PKP

Our bible is incomplete... the dead sea scrolls are a complete collection (due to their condition--some information is missing.) The Jewish bible contains most of these books (perhaps very close to all... I am unsure on this...)

The Catholic bible contains some of these books... it has been rumored the Catholics have the complete works, and always have... but that some of the bible was viewed as "too difficult for the common man to grasp", now it would be upsetting for them to step forth and make the statement, "we will now give you all of the information..."--not conductive to having people trust them in being "up-front."

Here is a link to bring one up-to-speed and give them a hint of reality...
http://www.sacred-texts.com/bib/apo/

Warmest regards,
John

>Also, what of the original "ECHO" , a metalic baloon launched as a
>satellite- acted as a reflector - was pretty big for it's day, tho
>obviously, not the most effecient. Jim NN7K

ECHO was a 100' balloon constructed from 1 mil aluminized mylar. It was an early attempt to achieve global TV transmission by reflecting signals from the ground station, launched on August 8, 1960. Proved unuseful due to the excessive power required of the ground transmitter.

ECHO had two beacon transmitters, one at each pole, operating on 108 and 108.3 MHz. I had the priviledge of designing the antennas used on the beacon. One of my colleagues at RCA designed and built the 10 mw transmitters. The purpose of the beacons was to assure knowledge of the balloon's position duing launch in case it was obscured by clouds.

Pictures showing the beacons and the technician attaching them to the balloon material will appear in my book Reflections 3, which is now in the production stage.

Reg Edwards wrote:
> Are you all scared of being attacked?

Not scared - just possessing health insurance against criminals.

Police do not *prevent* crime. Police only try to catch a criminal
after a crime has been committed - sometimes long after. Crime
took a nosedive when Texas adopted the concealed carry permit
which is reciprocal with another dozen states. Someone who is in
a position to know told me that one out of every 10 adult males
in my home county has a concealed carry permit. I can drive from
Arizona to North Carolina while legally carrying a concealed Colt
45. (It would be coast to coast except for the left coast.)

>TorrentStorm, behind a NAT, but that has never been an issue before.

The documentation at BitTorrent.com points out that downloads may not work, or may be quite slow, if you're behind a NAT and don't arrange for port forwarding of inbound connections from your peers. In this situation, you can end up being unable to exchange data with some or all of the peer sites you try to connect with.

As I understand it, this shouldn't affect the seeder I'm running, since it already has a complete copy of the file and doesn't insist on a tit-for-tat exchange of data. However, it's possible that there may still be some issues, with some NATs or firewalls.

Both my tracker, and my seeder clients, use the BitTorrent 4.01 reference implementation, and neither is behind a NAT. I've been able to transfer successfully from a system here at work which *is* behind a NAT, and the transfer went quite efficiently. So, it's possible that the problem lies at your end, although that's not a certainty.

My system _does_ react rather strongly, in defense, against systems which appear to be trying to port-scan it for vulnerabilities or trojans... it'll slap down a hard IP filter against such systems and will appear to "vanish" from the net.

Many here seem to be hung up on .pdf files, adobes pdf creator is expensive.

Here is a utility which installs itself like a printer, all you do is choose to print from any windows application, choose this printer driver and it will "print" a .pdf file of any word, notepad, etc. And you end up with a .pdf of the work in question...

Warmest regards,
John

I found the applet that used to be on the Hivelogic website:
http://automaticlabs.com/products/enkoder

You can either download it and run it on your PC or you can run it online.
Either way, the java code it produces looks like this:

```
<script type="text/javascript">
//<![CDATA[
function hiveware_enkoder(){var i,j,x,y,x=
"x=\"783d2232517d783635363d5c22363432303436663636373633373236663536643664366432"
+
"3635363037336537343730363265373136643737323265353639376332323436353365343243"
+
"3832333663323363363936363132333662303638323036373236383635353636373632363364"
+
"3535323063323237343636643666323031363937333636633735366534366636343233613737"
+
"3036643236313635323663363036313536663665323665363036353534303664363733363137"
+
"3639323633366332363736313336363366632663636323631336531366332323265363933"
+
"6265363533303373435625c223b633232793d27323037273b663436396f7228373436693d"
+
```

This is actually only about half of the code. I doubt a spider would find
my address in there.

You then paste this code into your HTML.

73,

Roger K6XQ

On 03/21/05 09:17 pm Richard Clark tossed the following ingredients into the ever-growing pot of cybersoup:

>>If it wasn't for us war mongering yanks y'all would be speaking
>>German.

> If it weren't for the Brits, we would all be speaking Dutch. Or
> French. Or Spanish.

At least Dutch has consistent spelling and pronunciation: once you know the rules, you know how to pronounce anything you see. Not like English, which has no rules at all: think of "cough," "rough," "through," "although," etc.

Thanks for the response. I don't think I have a problem with the
network side, since I forward the torrent port to that box, and my ACL
allows that port to see all public addresses. I have a Cisco IOS DSL
router running the latest release, so I have a bit more flexibility than
most. I'll give it another shot tonight.

OK, good luck - please let me know how it goes.

You might want to check to make sure that you forward both the torrent
management port, and the full range of torrent-client ports. Since
I'm running two seeders, they're on two different ports on my system
and might be trying to talk to different ports in your client's range.

They tend to be based on Ghostscript, the almost GPL utility that converts from postscript to raster, postscript to PDF etc. Very handy and source code is available. From memory the "first" Windows implementation also used "redmon", a printer port redirector. The idea being that you used standard postscript driver and the output stream normally destined for the printer was fed into the stdin on ghostscript. The output can be set to all types of file or device types. If you go this way it is worthwhile downloading Adobe's distiller PPD and using that instead of a standard Windoze printer driver.

Ghostscript is used extensively in Linux to convert PS printer streams to specific printer device types.

Pls be careful of the license provisions as it isnt quite open GPL. They tend to leave older versions for almost unrestricted use but more recent ones have rules of use. If of course you are a home/provate user it isnt a problem.

Also keep in mind that the Adobe creator does a lot more than just "distill" like the free versions do. Depends on your needs of course!

Cheers Bob

Right... it'd the difference between the AFPL (formerly Alladin)
version, which is more up to date and has a more restrictive license,
and the GPL (formerly GNU) version. The AFPL license, for example,
forbids commercial (for-money) distribution.

AFPL GhostScript is currently at 8.51, GPL Ghostscript is at 8.15
(dates to last September).

I am pretty sure you will want PDF4FREE once you become proficient and experienced with .pdf files, it is NOT based on ghostscript--however, you must have adobe acrobat installed... all you need is the single 600K+ pdf4free file... small, efficient, accurate...
1) download it
2) click on it to install it
3) reboot
4) print with it

Ghostscript is a most notable offering, and does quite well, however, with very complex documents you will find slight to moderate errors are encountered (this has to do with patents and rights held by adobe and is to be expected.)

Also, transforming PDF to DOC or other format, or viewing in 3rd party .pdf readers, will get "weird", sometimes, if the .pdf was created with the Ghostscript .dll--I have never found this with pdf4free...

Only drawback is you MUST have windows 2000 or better... but then you should anyway...

Warmest regards,
John

You're correct. The losses in the paper clip itself would be huge, due to the resistance of the conductor in conjunction with the huge amount of current which would flow for a given amount of applied power.

That web page has some factual information, but unfortunately it's interspersed with a nearly equal amount of misinformation. Readers of web pages should use caution in believing what they see.

No go, and I added extra ports - 6882-6889.

Your end is trying to connect on nonstandard ports back to my end. They
are not ports listed on any of the torrent pages I've looked at,
assuming your end is 195.23.xxx.xxx. It tried from 6882 on your end to
2471, 2523, and 2546 on my end. 6882 is fine, but as a destination.

That's close. The police affect crime rates after the fact by passing the suspects over to the justice system, where they may or may not be locked up, hopefully depending upon whether they are guilty or not. Note that I didn't say innocent, we don't use that concept in the US, but that is a different story. Not guilty does not always mean innocent.

Being locked up affects the crime rate from the back end, while self defense, in all of its different forms, affect it on the front end. And I will state, most happily, that there are many non-gun ways to "defend" yourself. For instance, owning a noisy dog is a good defense against the common burglar.

Personally I keep my .38 special loaded with rat shot, and my Ruger with a follow up in case they don't understand the noise and slight pain.

> this...)

Whether or not you regard our Bible as "complete" depends both on your definition of "the Bible" and "complete." If you're a Roman Catholic (as I am), the Bible is complete by definition: it consists of the books that are recognized by the Church as the Bible; what they are was decided by the Council of Trent in 1546 (if you're not a Catholic, there are other sets that are recognized).

The Dead Sea Scrolls are by no means a "complete" collection of anything; so far as I know, there were in fact no scrolls found that we didn't already have other copies of.

There are, of course, many books that were written as scripture which are not recognized by the Catholic Church (or by any other Christian church I'm aware of) as canonical. These are normally described when offered for sale as books that have been suppressed by the Church and are only now coming available... maybe the Church suppressed them once (sad to say, this wouldn't surprise me at all), but they've been widely available for centuries, and are really, really bad (my not-so-humble opinion, after having read a bunch of the early Christian writings that didn't make the cut).

There are also a lot of early writings that are just plain lost, like the original Gospel of Matthew.

> The Catholic bible contains some of these books... it has been rumored the

> trust them in being "up-front."

The Apocrypha (we call them deuterocanonical books) are simply books that the Catholics regard as canonical and the Protestants don't, no more and no less. It isn't like we've got special access that the others don't... just go find a Catholic Bible and you're welcome to read them.

Got a cite on the rumors that the Vatican has a "complete" collection
of the Bible it's never let out? I've never seen a credible claim to
that effect, and would find it almost impossible to imagine how a
claim that wild could be made credible.

> Here is a link to bring one up-to-speed and give them a hint of reality...
> http://www.sacred-texts.com/bib/apo/

Just a short essay on the Apocrypha. A better place to look for books
not regarded (by us!) as canonical is www.gnosis.org (this is an
organization devoted to Gnosticism, a set of beliefs superficially
similar to but in fact radically different from Christianity or
Judaism).

I am positive of one thing, if there is a "God", he is NOT in total agreement with the Catholic church...

A church is when 3 or more gather in Gods' name--that is HIS definition--not the Catholic church's...

Church doctrine and the "Word of God" should be viewed as two entirely different things--God has no ego, only man and the "church" has...

Warmest regards,
John

Fairy tales, Fairy tales.

You know, I usually try to stay away from this crap because I know a certain park is slanted to the Christian side.

But when this crap keeps happening, then you realize what the goal is.

To convert as many as possible. They don't care if you have problems, don't care about your life. Just that you "found god" and are a Christian. Give your money to the church and then go out there and convert as many people as possible.

This is the "real side" of christians and shows thru.

Too bad, because a certain park tries to play the fence on this issue, with a christian show, and other family events. Sorry, but I've got to put my foot down here.

I didn't name the park (I could have), but they know who they are, and everyone knows too.

Here is what I found with Google:

http://www.answers.com/topic/wullenweber

A boyhood pal went into the Army and spent a year at Ramasun Station.
He explained it to me thirty years ago. As the article states, it is
a "Circularly Disposed Dipole Array". Other pictures show a building
in the center of the array where radio intercept operations were
conducted. The circuitry used to "rotate" the array was quite
complex. They have indeed been dismantled.

Why would the mention of a particular type of tool frighten you so
much that you would be compelled to interject a disparaging comment
about it? The world and usenet are very big places and not all of it
is the UK.

Low antenna efficiency coupled with a transmission line mismatch made for
poor performance from these antennas.

At one time I have seen available 2 m / 70 cm dual band
antennas in a Marine mount but I have not been able to locate one
recently.

Nope, that's somebody else - the IP range looks like it's in Portugal.
It _could_ be someone else who is fetching the torrent and is trying
to peer with you (there's one active downloader for each of the two,
at the moment), or it could be J. Random Nastyguy portscanning your
system looking for trojans and etc.

I'm really not sure why you're having the problem. I do see that the
4.01 BitTorrent tracker has some logic which tries to figure out
whether the system asking for the download is behind a NAT, although
I'm not sure what it does with the information. I'll try restarting
the tracker and turning that feature off... maybe it'll make a
difference.

For those that want to play with Linux under Windows have a look at the cygwin system. (http://www.cygwin.com) You get the Linux CLI and if you want you can also run XWindows. You can probably run wget inside it as well although I havent checked. For a while I use to run XWindows apps from my "remote" Linux box on the W32 screen. (I have since converted to running Wine (windows emulator) under Linux or a VNC connection to my W98 laptop under the ebd!)

Cygwin is kind of handy for die hard W32 users that only need a little Linux now and then! There has also been a number of cross platform projects that need the cygwin libary and this can be compiled to run on both OS's. A good example of this is the RDFT code under Digtrx.

Cheers Bob

Ok, I'll try to give you a clue.

The park name starts with an H, had an ace member fall of the back of a coaster while standing up, and the park has no longer done any "ERT" events since. (And I don't think they will for a few years)

There, is that enough for you?

Can you figure it out, or do I have to actually name the park.

Freakin Christians. Now where was god on this one.

Oh, a test, yeah right. A test.

No No, just face it, god does not exist, it's all a bunch of fairy tales.

Makes things much easier when accidents happen.

They are not tests. It's reality.

Jon,

I would expect the marine antenna to perform poorly, due to high SWR.
However, I am not sure of your second question. Are you looking for a
2M/440 antenna for a boat, or for automobile mount? A number of vendors
(Larson, Antenex, Comet?, etc.) sell dual band mobile antennas for those
two ham bands. For a boat, I don't know of any dualband stuff, but those
same vendors sell a base loaded half wave antenna for single ham bands
that doesn't require any ground plane. Good Luck.

It's sure tempting. I've already got fairly hard email blocks against
most of the far east. For a couple of my domains, I've even
programmed by DNS servers not to respond to queries from those
areas... just too darned much spam.

>Well no matter, I'll live without it. Sounded good though.

I've turned off the NAT-check filter, and noticed that the number of
downloaders jumped up suddenly from 2 to 4. You might want to give it
another try and see if it works this time. My tracker may have
"noticed" that you were behind a NAT, and decided to snub you...
that won't happen now.

Another thing to check, is to see what happens to *outbound*
connections from your system, to port 6881 on other peoples' systems.
I can see that my own downloader (which has a complete copy) initiated
an outbound connection from its port 2723 to someone else's 6881. It's
conceivable that your downloader tried to "connect out" to someone
else's 6881, did so from a dynamically-assigned port number, and that
your firewall rules are blocking the SYN/ACK connection responses back
from the other downloader's 6881.

If that still won't work, then you might want to check at
http://www.r-bonomi.com/radio/ - you can probably get a copy via HTTP
from there.

No joy on torrent from your site, and I have test downloaded from
several other places with no problems at all. Wonder what the heck the
deal is.

Oh yeah, we will get right on that--run one OS so we can run another right on top of it...

Dual boot, run your games in windows, go linux for root hacking... don't run windows, so you can run linux on top of it, so you can go root hacking into the old guys computers here... they arent' a challenge anyway--go beat up on other teenagers...

Warmest regards,
John

I tried several myself, and settled on PDF Creator also - because the
resulting PDF files were generally smaller.
I use it to convert powerpoint presentations to PDF - and it works great.
The resulting PDF files are usually significantly smaller than the original
ppt files.

Source record: 76515
Cross-posted to:
rec.music.progressive,rec.music.rock-pop-r+b.1950s,rec.radio.amateur.antenna,rec.autos.makers.chrysler,rec.roller-coaster

In rec.roller-coaster John Smith <assemblywizard@gmail.com> wrote, in
response to NoGodForMe <religionkills@fairytales.com>:

: : Can you translate that for me? And what H3LL is a "park?"
:
: Warmest regards,
: John

A "park" is a defined space set aside for recreational activity. The
correspondent in question is referring to a subset of "park" known as an
"amusement park" which is a defined space, generally operated as a
private business, containing attractions designed to provide patrons with
excitement or amusement.

This thread is wickedly cross-posted (and I left it that way since you,
John, clearly don't come from my "world") and that particular response
came from 'rec.roller-coaster' (r.r-c). One amusement park in particular,
among the 200+ parks in the United States, happens to be exceptionally
well-respected among many people on r.r-c, and also is unashamed to admit
its owners' Christian faith.

It's not the only such park out there (I can name three more right off
the top of my head) but most of us know which one he's talking about.

if you know how to use Adobe , yes you can block it from printing out to word as saved text.

My company produces competitive intelligence and we construct pdf's in a way that you can NOT export the text in anyway, except if you want to type it out by hand

If you want to take up the challenge let me know

We can meet on AIM or YIM, I can send you a PDF sample via file transfer and see how long it takes for you to crack the PDF. If it is a software trick, the size of the PDF wont matter.

I can type 10 pages of text in about 12 minutes too if thats what you were thinking.

Otherwise, get a webcam or fly to new york and let me see how you do it snappy.

Chris wrote: "?"

I saw a response noting earth-moon-earth amateur transmissions. The moon is a large reflector but its spherical shape temds to scatter energy , not concentrate it in a beam as a concave shape might.

Another response was:
"The Sun for transmission, and the earth for reception."

The earth is conductive. So it interferes with straight line transmission of waves from the sun. It casts a shadow. It is conductive, so the earth does not absoeb all the radio energy it receives form the sun. It must re-radiate much of the energy it receives, related to its impedance discontinuity with that of the unabsorbed energy striking it.

A lightning bolt travels an ionized path which is a good conductor and suffices to radiate static around the globe. Martin A. Ulman in "Lightning", Dover Books, 1984, says the ionized trail may reach 30,000 degrees K and a length of 14 km (8 miles). That`s a long antenna but may not be a record even for lightning.

Best regards, Richard Harrison, KB5WZI

Oh, silly me, didn't include how to use the information on those proxies...
here is how microsoft suggests doing it, for internet explorer...
http://support.microsoft.com/?kbid=135982
Don't forget to turn off the proxy (remove the proxy setting) if you lose
internet connection... these proxies disappear if the computer you are
preying through shutsdown or turns off proxy sharing... if so, just grab a
new proxy address and port off that page, in the previous post, and plug it
in and off ya go...

Warmest regards,
John

Yes, there are four wires. Ok. Now I understand, it is called a Fan Dipole. Thanks.

Okay. I did afew simple tests this morning. With output power at the lowest level (L - on IC-706, I guess this may output 5 W probably), I measured the SWR at various points at 14 and 7 Mhz. For 7 Mhz, I had to increase the power, as the SWR meter needle couldn't achieve full swing when measuring FWD power. I used CW as input. The SWR seem to be around 1.25 to 1.5 for higher frequencies (for almost all of 14 mhz), but touches very high values 4 and above on 7 Mhz. I used around 20W for 7 Mhz to achieve the needle full swing. By the time, I finished the 7 mhz tests, the radio got heated up. I suspect, that there can be an open circuit at the balun-antenna connection for 40m dipole wires(?). I am not sure.. Anyway, I am going to rework the entire antenna installation this weekend or next. Too bad, I cannot do it before. :-(

I take this whole issue of SWR mismatch as a blessing in disguise, as it prompted me to read a lot on dipoles, transmision lines, baluns and general antenna installation decisions.

Hi Ramakrishnan,

Sounds like 40M needs work. The SWR values for 20M were spot on.
Well, when you get to it this weekend, you should be aware that for a
fan dipole, you should adjust the lower frequency band first. This is
because its tune will cast an effect into the higher frequency dipole
(because of near proximity - otherwise known as coupling and their
harmonic relationship). Undoubtedly this tuning of 40M is going to
upset what appears to be a well tuned 20M dipole. Such is life.

Likewise, tuning the 20M side will cast an effect into the lower
frequency dipole, but to a lesser degree. Several back-and-forths and
the job should be done.

Again, the lesson of flexibility and anticipating these ups and downs
can reduce the pain of repetition.

By keeping the two dipoles' ends further separated, you can reduce
this coupling. However, I am sure this is dictated by the anchor
points that support your antennas. You can allow the 20M to droop
further away from the higher span of the 40M to accomplish this -
several feet is a useful guide suggested here, although others might
suggest less.

> By the time, I finished the 7 mhz
>tests, the radio got heated up. I suspect, that there can be an open
>circuit at the balun-antenna connection for 40m dipole wires(?).

No, this "heating up" was a product of what I described earlier. If
your balun-antenna connection works so well for 20M, it isn't going to
limp along for 40M. A 1:1 W2DU style BalUn is very robust over the
majority of HF, and certainly for these bands.

Beats me! This is really strange. There have been a total of 80
successful downloads so far.

Protocol-revision problems? Moon in the wrong phase? I just don't
get it.

So far, I haven't figured out the magic incantation to get the tracker
to tell me who it thinks is connected, and what they're doing. I'll
keep poking at it when I have the opportunity.

If You can drill a hole in Your motorola's plastic enclosure
(it's probably removable so You can have one for replacement)
probably there will be 50OHm port inside.
When they test phones - all have to be connected with measuring
equipment - directly feed through 50Ohm cable /there are some
situations that producer prepares "test fixture" which looks just
like small patch antenna mounted on the phone/. Anyway - even on
nokia 3650 (this model has internal tri-band patch antenna)- when You
remove front panel - there is a connector - to simplify test setups.

Source record: 76431

Hello to all,

I have searched but nothing fits the bill for what I want to do.
Anyways, right now I have a 20m homebrew dipole in my attic at about
20ft. I want to get a 20m wire antenna outside but I live in a condo.
I have, as I see it, two options-

1. Put a vertical dipole from my chimney (35ft) to the ground. I have
a very small patio area so the angle of the wire will be about 70-80
degrees.

2. There is about 100 ft between two unit chimneys. As no antennas
are allowed, however there is a satellite dish at every turn, I would
need to be super stealth and get permission from the neighbors that own
the other chimney (good luck on that), but I could put a dipole between
the two chimneys.

I have looked into a vertical, but I have no room for radials. My
patio is 6 ft deep and maybe 10 ft long.

Any suggestions?

>ki4bbl

Gregg,

AL7KT, a friend of mine lives in an apartment that forbids antennas. He has a loop antenna for 80 meters on his roof that goes around four chimneys. The wire lays on the roof and 300 ohm TV twinlead (low-loss from rat-shack) comes down the corner and is painted the color of the apartments. His antenna accidentally fits on 80 meters and dips below 1.5:1 on all but two bands, one WARC. He uses the internal tuner on his Kenwood TS-440SAT and operates where ever his privileges allow.

His concern is that the wire is literally ON the roof and that instead of being flat, it has the two inverted vee shapes on the two sides. The wire is number 14, but it is black and disappears against the dark gray shingles on the roof. Unless you are looking for it, the 300 ohm twin lead just disappears due to being painted like the building.

The antenna mostly works well. In only three conversations, his loop outperformed my 80 and 40 meter sloping dipole hands down, but on 20 meters I was making contacts he couldn't even hear, but then my 20 meter dipole is about 75 feet or so high with one leg slanted upwards by about 60 degrees or so from there. We live about 10 miles or so in a crows flight and could barely hear each other on 20 meters. The little time we spent comparing signals could not be mistaken for being a valid comparison of antennas, but it did prove his antenna worked.

If you can support and hide your coax from the feed point, you can consider using magnet wire for the dipole. The wire stretched between the two chimneys would otherwise go unnoticed. If you need more strength, you may be able to find some insulated small gauge wire, 18 or smaller, where the color blends into the background and yet the wire will withstand a little more abuse.

If nothing else, I hope what I said help you get your wheels turning
towards finding you a solution. Good luck

Dear Russ,

I appreciate the correction. Obviously the spelling was correct as it was and the story that I had been told about it must be apocryphal. I suppose even the surname (Familiename) Wullenweber would be a corruption of Wollenweber. Your reference to the history of the system proved quite interesting. Obviously, I was also wrong about the location - although Augsberg is certainly not that far from Stuttgart - Hi. When I lived in Wiesbaden many years ago I should have traveled to the site and had a peak at it.

Very good idea. I am using a ts-520 with a pi-network so hopefully I can tune it. I think I will give it a shot. I was worried about having it lay on the roof, but if experience states it works, I'm up for it. Ladder line will not work on the 520, but I do have a tuner that will match it, so I will give it a shot.

A 20-meter "random wire" I experimented with over the weekend might
work in your setup. It's an end-fed wire -- the Arrl antenna book
recommends an odd number of quarter waves -- I chose three, making the
wire about 49 feet long, attached directly to an "L" antenna tuner in
the shack. I also attached a single elevated quarter wave radial to
the tuner chassis; just ran it out the window and along the house, and
that tamed whatever in-shack rf I had. Got an easy 1:1 match.

If your shack is on the ground floor, such a wire could go straight
up, and then across your roof. Use tiny wire; plastic button
insulators, zig-zag it, etc...

Greg:

If cramped for space with a vertical, you could always use a short whip at the top and helically wind the rest of the antenna to be one-half wave electrical length and one-quarter physical length, and using a L-match to feed it with coax. This would allow you to get by with no groundplane, if you desired, you could feed it against a small counterpoise...

Warmest regards,
John

John/Ed,

It's for a sailboat (all this has been hashed over in
rec.boats.electronics - I mistakenly cross-posted to rec.radio.antenna,
rather than rec.radio.amateur.antenna, so you guys missed the thread
there). The general consensus is it would be easier to use two antennas,
but I'd have to enlarge the holes in the compression post under the mast

and the mast itself in order to run another cable. If I could find a pair of diplexers, then at least both radio/antenna combos could share the same feedline up the mast...

Anyone know of a 2m/70cm diplexer with tight enough filter slope to put the marine band on the same side as the 70cm, or one specific to 2m/marine?

Jon KB1HTW

Does this park feature an attraction that simulates crucifixion? Or
perhaps being fed to lions? That would be cool.

Tony

another thought might be to mount a screwdriver antenna on your
chimney. You will need some form of radial or ground system, but that
might be a multimode solution.

Just a thought, but it is different from what you are asking.

I just talked to Al, AL7KT on two meters. He says the 75 meter group which he meets every evening, tell him he sounds like he has an amplifier. He says that on 80 and 40 it is fantastic.

He says that everyone keeps telling him he is doing it all wrong. The antenna is allegedly 100 ohms and he is feeding it with 300 ohm tv twin lead and then a 1:1 balun to a short piece of RG-8 (about 3 feet) to the rig. We don't know the true length of the loop as we didn't measure it, we just stretched it out and cut it where it came back together. We could estimate the length of the wire, I guess, or the twin-lead.

Oh, also, the twin lead was laying on the ground. He took a staple gun and stapled it on the side of the building and trimmed off the excess so it no longer drags the ground. Before doing this, the antenna only matched two bands, now it matches all but two of the 80-10 meter bands including WARC, but I am not sure if he included 60 meters.

No need for dual boot - use dual computers. The good one here runs Linux,
the clunker has Windows. Cygwin is mandatory on the windows machine for
those times when I want the power and flexibility of a real OS.

BTW - Cygwin apps can be run from a CDROM without installing on the host
machine. Very nice for those of us who are stuck with Windows on our
machines at work.

You can 'Create Java Programs for free' by downloading the Java JDK and Java tutorial from http://Java.sun.com - and Python programming at Python.org - and PHP programmnig, and Perl programming at activestate.com.
and you can host your own website by downloading a free server from Apache.org.
then you have openOffice.org for an office suite that's free and Gimp for image manipulation - and Satori

Yea, I've seen that. They also make a "sleeve" version
which is a perfect match for my nokia phone. I just wonder
how well they actually work...Actually, I would prefer to make
one myself, but I'm not sure how I would want to go about it..
IE: would I need a resonant 800 mhz "coupling antenna", etc..
I tried just making a experimental patch out of foil, and sticking
it on the back, behind the internal antenna, but it didn't seem to
work.. Anyone have any good ideas how to homebrew one?
Actually, I've also been considering just drilling a hole in the phone,

and installing a antenna port....

Java is OK for Linux, C# is better on windows machines (both use the "C" programming syntax--both are scripting languages--if you are going to use a scripting language get activeperl, it is free and the best)... Windows XP no longer supports java--if you patch with SP2 (and you most certainly should) java is lost and must be installed as a third party component from the SUN Microsystems site... I don't use Java--too slow... most malicious webpage/email/newsgroup attacks are in java these days... although few are successful--some are... scriptkiddies favorite language is Java...

Warmest regards,
John

sounds like you're mixing up Java and JavaScript.
Java is really a good language for Linux - and Wndows - And for i-series (AS/400)
C# is a java wannabe. (VB.net runs as fast as C#)
You call them scripting languages - but they're really hybrids - they are compiled - but not to machine language.
Java needs the JVM - and C# needs the dot-net framework.
Java will run on most platforms.
C# will run on windows.
Java rules.
C# is not my favorite language - in case I wasn't clear.
I like Python better than Perl. It is Object-oriented. Java spoiled me for OO.
When it comes to server-side programming, Java is the one - JSP and servlets.

Java is NOT a computer language... script compilers have always been available, perl has one also, as does C#, wsh, etc--java "compiled" is really still a script calling winapi's on windows, and calls into kernel code in Linux...

... it is slow...

There is nothing wrong with scripting languages, I use perl all the time (but I don't bother with the "compiler")--indeed, one scripting language is enough--why the world wants a hundred is above my understanding... windows wish/wsh has front ends for most, so you can write in the syntax you are fluent in--perl--wish--C#--java--etc--in fact--this is how they implemented Java on their platform, and why SUN sued them and they removed it... Java--Java Beans--Javascript is all pretty much the same--mostly "compiling" only obfuscates the code--at first this made it difficult for others to copy--now Java "de-compilers" tear it apart to the base source code with ease... Java "compiles" in OS specific format--javascript is in webpages... the JIT (Just In Time compiler) "runs" that java code on a windows system... what ultimately runs--used to be the wsh/wish windows script--now since SUN sued, you must get their binaries...

Warmest regards,
John

John, I know that some duplexer manufacturer such as Tx/Rx (http://www.txrx.com) make a pretty small repeater duplexer for VHF that would handle the split between amateur and marine band.... if you were to separate the cavities and use them in your manner... but not sure if they would still be frequency broad enough, or small enough if space is really cramped in the cabin. Something to research, anyway.

QUESTION, though. What size or type of cable is currently run up in the mast?

King Harald might have had some comment for you, had he been coherent after
the Norman arrow pierced his eye & brain. He was subsequently sliced and
diced, and English history got a serious dose of Gallic flavor.

This is what happens when a thread becomes cross-posted to diverse special interest groups. The progressive music people don't talk the jargon of antenna designers, and roller coaster guys think everyone knows what a park is.

What danger, if any, is there when resonant 40m, 30m, and 20m dipole elements in parallel with RG58 coaxial cable feed and the radio's internal ATU are used on the 17m, 15m, 12m, and 10m bands?

The ATU permits loading of the non-resonant bands to full RF output, but I have had a blown capacitor that is used within the LowPassFilter for the 40m channel and another capacitor blown within the 12m/10m channel.

Hi Vince, do you know if the caps in the filters blew while the ATU
was in the process of "tuning"? Or did they blow during normal
operation after the ATU had already "tuned"? The filters should see
their designed for impedance after the ATU successfully "tunes" to your
antenna system impedance. The filters will see all sorts of impedances
during the tunning process, and this time the caps in the filters will
be under the most stress. Another could be a connection problem in
your antenna system causing the impedance the ATU sees to change
intermittently.
My xcvr instruction book says use the lowest possible rf output power
setting when using the internal automatic antenna tuner.

The sum of the forward voltage and reflected voltage probably
exceeded the ratings of the caps. There is a specified limit
to the SWR that can be tolerated on my IC-756PRO, for instance.
Have you measured your SWR on every band and abided by the
maximum SWR specifications for your rig? If not, please do so.

Ed,

It's marine-grade RG-8x. The antenna is at the top of the mast, 36 ft
above the cabin top.

3410. Make money searching in google

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-26 19:10:41 UTC
From: xtodopoderoso@yahoo.com.ar
Message-ID: <1117134641.695487.62820@f14g2000cwb.googlegroups.com>
Source record: 76325

ello everybody, I found on the web an interesting way to gain some
money:
it's netbux, that allows you to learn something while you search the
web
through google or altaista.
I earned 40$ in a month, not a lot, but I have simply to use Google to
do My
searches.
If you want try it subscribe at:

http://netbux.org/?r=241779

Here I post the mail that convinced me to start making money!

It pays you $0.01 - $0.05 for every search you make on major search engines. You can potentially earn $200 - $5000 Per Month just by searching the web. A Decent Second Income, right?

With Netbux, you get paid to search on Google, Yahoo, MSN, AOL, Alta vista, All The Web, Excite, Lycos, LookSmart, Ask Jeeves, Dog Pile, Dictionary, Downloads, Ebay and more...

Search anything, absolutely anything! You get paid!!

Upto 40 searches daily.

It takes only 10-15 minutes to complete 40 searches.

100% direct referrals' search earnings.

Minimum Payout: $75.0

Payments via Stormpay or Check on 15th of every month.

Please note that Netbux pays in shares for searches. Shares are the credits that you earn when using Netbux. At the beginning of each month a value of a share is determined according to the total amount of revenue that Netbux generated for the previous month. SHARES ARE CONVERTED INTO CASH AFTER EVERY MONTH. So, a share could be worth as much as $.01 - $.05 or more, BUT NOT ANY LESS. You will earn 1 share per search that you and your referrals make for up to 40 searches per day, per person. So if each referral maxed their paid searches out per day and you had only 10 referrals, you would earn 26,400 shares per month. Now, if the value of each share came to be $.02 for the month than you would have earned $264.00 for the month! What if over time you accumulated 20, 30, 50, 100 or more? This program is real and have already paid out to members. All together, $8,570.46 was the total amount of payments for April! The highest paid member earned $846.04!

The average payout was about $124.00! The next payout is estimated to be over $20,000! Don't you want a piece of the pie? Click Here

Hi Gary:

I normally leave the ATU in my FT1kD enabled at all times.
In both instances, the ATU had finished tuning for the aerial wires.
Operation on the 40m band actually does not require the ATU to be
enabled, since the VSWR is very good across the lower 100 kHz of the
band.

All caps within the LPF band/channel were replaced at the same time; I
do not know which cap blew out or was the cause of no RF output at the
time on that band. The last time that this happened, (12m/10m LPF) I
did notice that a capacitor closest to the PA finals showed indication
of swetting.

Vince, as far as answering your orginal question, does your antenna configuration cause caps to fail in the filters in your xcvr, the answer should be no. If the tuner can achieve a match, or the antenna system presents a good match, as you indicate it does on 40M, then everything should be fine.
The filters are between the PA and the tuner. If the tuner does its job, then the filters and its components should be happy. As I mentioned, during the tuning process, the filters may get stressed.

3414. routing coax through strong DC magnetic fields

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-26 23:04:05 UTC
From: Tracy Hall <uce.dump@gmail.com>
Message-ID: <1117148645.754247.320070@f14g2000cwb.googlegroups.com>
Source record: 76328
Cross-posted to: rec.radio.amateur.antenna,sci.physics.electromag,sci.electronics.design,sci.physics

I understand that coaxial cable does not radiate much energy because symmetric opposing current sheets in the outer skin of the center conductor and the inner skin of the shield essentially balance each other.

Suppose I route coax through a strong DC magnetic field, such as in an MRI, with the magnetic field perpendicular to the cable axis. Will the current distribution in the center conductor then become biased "up" with respect to the field (right hand rule), and the current distribution in the shield then become biased "down," thereby destroying symmetry?

If so, will the coax then radiate and become lossy?

Can anyone point me to an analysis of this problem?

Thanks,

Tracy Hall

I think the signal in the coax and the DC magnetic field will obey
superposition and that the coax will stay shielded as well as it would
otherwise.

Can't point you to any studies or the like, but coaxes in our klystron amp's
pass by the klystrons with no ill effects noted.

Ken

no, the coax fields still cancel at a distance (small)

But most coax is between 90% and 98% covered, not 100%, so there can be
leakage into or out of but not at DC, there is no effect on the coax (which
is high frequency)

If you <<shake>> the coax real hard
in the dc magnetic field,
you probably still won't affect the coax on hf or vhf.

There are many, I don't know about webstripper--however, there was one--I think it was/is called "WebFerrit"--it had spyware in it...
I am pretty sure the software I recommend does not contain such evil junk... however, one should always double-check everyone and everything... I simply trust it enough to use it and mention Httrack...

One should always read some reviews and see if there is any mention of malicious code included in an app before one installs it--and, maybe wait awhile after new software is released, let others find out about it before taking a chance... and ALWAYS, ALWAYS download from sites you trust--if you don't trust them, wait a bit till ya know more!!!

... just some thoughts on the matter...

Warmest regards,
John

You are seeing the results of using the ATU for
a purpose it was not designed for. Internal ATU's
in general, were never intended to be used as full
range tuners. They were intended to be used as
"line flatteners", where the mismatch is not too far
out of line...I would use a stouter outboard tuner to
do what you are doing...It's doesn't have to be fancy.
A simple L tuner would probably match most of what
you are doing...BTW...On the bands with very high
SWR, your loss using that rg-58 is going to be
substantial. How bad, depends on the SWR. If you
are under 5:1 or so, not too awful bad...Over 10:1,
it's starting to be loss oclock.. MK

Dear Tracy,

No, I don't believe that the "biasing" up and down that you refer to
will cause any destruction of symmetry, because everything is linear.
So long a linearity prevails, there will be no effect whatsoever due
to the DC field, in my opinion.

analyze this way...
if the current in the coax is AC then each half cycle the electron flow
reverses so the forces would reverse, and since the actual electron velocity
is relatively low there would not be enough time for the electrons to really
move before the current reversed and they had to go the other direction. so
i would say that it would be unlikely to have any effect on coax carrying
AC. now, if you go to very low frequencies where the electrons have a
chance to move you might be able to measure something, but since the
wavelength increases with the lower frequency the relative size of any
imbalance becomes smaller. and essentially if it did completely separate
you still end up with balanced currents but in a twin lead arrangement and
you still have currents that cancel at any distance away from the line.
what would be more interesting is to calculate the torque on a piece of
twinlead carrying dc in a strong field.

I think you're distorting the Hall Effect here. One side of each conductor will have a positive charge and the other side a negative charge, and there will be a potential across the shield and across the inner conductor. But at the ends of the cable these effects are gone.

> thereby destroying symmetry?
> If so, will the coax then radiate and become lossy?

No. Superposition of fields. Even for an AC magnetic field.

If you have an alternating AC magnetic field you can induce a current in both the shield and inner conductor, but these will match. If you've got ground loops you may misinterpret this as a signal. Don't have ground loops.

Tim.

To leading order, the superposition argument is right, but it assumes
that the current distribution in the coax is unchanged by the applied DC
field, which is not true in detail.

The Hall effect operates in metals, so an AC current in the shield will
indeed cause an AC voltage across the diameter of the coax shield,

outside as well as inside, and this will radiate as an electric dipole.

However, the Hall effect in metals is so small that it's difficult even to measure it, and the electric dipole radiation from a source very small compared to a wavelength is weak. The resulting leakage is therefore (miniscule)**2, far smaller than that caused by the poor shield coverage and poor shield continuity.

The shield conductors are just laid on top of each other, and since their contacts are neither gas-tight nor self-wiping, they are somewhat noisy and unreliable--we don't rely on that sort of contact elsewhere in electronics.

Cheers,

Phil Hobbs

3437. Co-phasing Wheel Antenna

A constant (DC) magnetic field has no effect on either the current
distribution or the voltage in a coaxial (or any other type) of cable.
Regards,
Jon

> above the cabin top.
>

My thought, in asking this questions, was replacing the current coax with two of smaller diameter, since you said the current hole in the mast was too small to add one. Commerically, we often use a RG-58 type coax that has a white Teflon jacket, commonly referred to as Motorola White Teflon coax. It is considerably smaller than RG-8X and I would hazzard to say you might be able to pull a pair of them up, using the original RG-8X as a pull line. You will need to obtain connectors with the proper size ferrule for it as it is smaller than RG-58. Good Luck.

Hi Joel,

I tried to respond via Agent, which is my browser of preference, but as of trying to respond to your post I can no longer access Agent to send. Still don't know why. This is the reason for the delayed response.

Anyway thanks for your interest in Reflections. The second Ed was released May 2001 and was sold out early in 2004. Been workin' on the 3rd ever since. A new Chapter 23 will have a new analysis of the quarter-wavelength transmission-line transformer, to correct some misleading material in the original copy. The new edition will also have some details on my development of the antennas that flew on the World's first wx satellites, as well as some of the quadrifilar helix antennas now flying on NOAA's polar-orbiting satellites.

Concerning a topic on rho >1, of course this involves lossy lines, which I have never studied very thoroughly, so I'm not about to expose my ignorance in that area. However, R.A.Chipman discusses it well in Schaum's Outline of Theory and Problems of Transmission Lines. Recommended reading.

Perl is good at what its designed for - text manipulation and report
generation.
And as they say - its also known as the Swiss-Army Chain Saw of languages.

To answer the question how is Java and the OO-languages better than Cobol
and the procedural languages.
You'll have to get into the Object-oriented way of thinking
(and it was not an easy paradigm shift for me)
Java 'grows on you' (some say 'like a mold')
at first its ok, because the syntax is easy enough.
Then you get into inheritance and Polymorphism and the other OO concepts
its a different way of thinking about programming.

google "Thinking in Java" or "Thinking in C++" by Bruce Eckel for a little
more insight into the OO-way.

Because it was posted with Outlook Express, which defaults to posting a HTML version of the message.

FWIW, we're all aware of the statistics. Whining about it makes no difference, posting statistics and complaining that Nero fiddles is equally useless. If you want amateur radio to survive, do something other than using Excel and Outlook Express to generate statistics.

It does, but it also helps to have more cutting edge modes. Let's face it, ax.25 is almost 25 years old and 300 baud data sent from the other side of the world these days has as much appeal as a tepid bowl of oatmeal.

Couple that with the fact that radio has pretty much lost its romance and mystique anyway. You'll find plenty of writers who mention sitting with the radio, tubes glowing listening late into the night to their favorite shows or distant lands on shortwave, but you won't find much about cuddling up with the transistor radio listening to AM talk radio.

Amateurs need to tap their existing resources, create real high speed spread spectrum modes (the HSMM guys have the right idea) within amateur bands. That'll attract a lot of people, and from there you can generate interests in other modes. Cement cool bonds between computers and amateur radio and you'll have a far better chance at attracting people.

OK! Aas a matter of fact, I've scanned in Chipman's book (it's available at
http://oregonstate.edu/~kolstadj/ as "Transmission Lines (Chipman).pdf"), but
I haven't actually had time to read any significant chunk of it yet.

Thanks, all, for your helpful responses.

The general consensus appears to be that a tiny electric dipole will be induced that oscillates transverse to the cable at the same frequency as the carrier. It might possibly leak a tiny amount of energy to the area immediately surrounding the coax, but probably not a significant amount compared to that which is already lost due to imperfections in the cable.

I'm not planning any installation in an MRI, but I do have an application where the cable is routed through some fairly strong permanent magnetic fields, and I wondered if I needed to magnetically shield the cable to avoid substantial losses. Sounds like I don't need to worry.

I suppose I could actually run a test, but it's a lot easier just to freeload off all your experience!

Dear Mr. Tom Lutz (W0ZR ?):
I am surprised that you have not received a reply. The combination of the two antennas would be a fine choice for working DX on all except 30 meters. Best on a tower over 70 feet above average ground.
The conventional wisdom (not accurately measured) is that LPDA prefer to be well separated from other antennas.
If you model the antennas in some version of NEC (EZNEC is preferred by me) it will be straight forward to see interactions.

You might wish to consider Tennadyne's new LPDA that extends down to 10 MHz.
http://www.tennadyne.com/new_models.htm

Might you have a set of dimensions of the antennas you are contemplating?

There is no Object Orientated Assembly Language (by definition)--it is the way you write the assembly code which will either make it OOP specification compliant, or not--I was lucky, I naturally wrote code that way, when it made/makes sense... from the start I seen myself showing up with a briefcase full of cdroms, all containing code from past projects, and written with procedure/function calls, containing data which was appropriate for each, using NO global data (well, sometimes ya gotta), appropriate use of dynamic and static .dll calls, so as to be sane, etc, etc... and constructing whole, new programs from what has already been built with highly structured code...

This is all OOP is--however, the "Pseudo-Intellectuals" immediately start banding about such terms, and do not understand that these terms are based on very simple principals--and that one does NOT need an "Object Orientated Language" to create such code--and yes, except for all data having to be global in the past, in Perl, you could have always written OOP in Perl if you had chosen (for the most part, that has all changed, now you can keep data and variables local)--sometimes, I still choose not to...

Java is a scripting language which can be "compiled", it is not a good language--it is popular with scriptkiddies (black hats) which think "C code" is difficult for others to understand--it is "C Syntax" and I am writing my memoirs in "C" !!!! <grin>

In the industry we watch out for people showing up and using "OOP" as they would George Bushes' name, or as a holy mantra--it shows they are either fresh out of college, or "Weekend Programmers", or worse, scriptkiddies...

Warmest regards,
John

Yep, you've got Chipman nailed down! His tome is one of my bibles. The others are Kraus' Antennas, and Ed Laport's Radio Antenna Engineering. I have scanned Laport to a CD, which I'll send you a copy unless you already have one. It's too large to email, and I don't yet have it available on my web page. So let me know if you'd like a copy. It's also a gold mine.

Thanks for top posting.

No, that's not true. You only create specific services that allow outbound Internet access. Certainly, you'd filter the living snot for web services so about the only place they could go would be arrl.org. But you can create a lot of interesting things along the lines of what ka9q did with his NOS package over packet. Except in this case, you'd actually have some speed to it and be able to use bonafide Internet protocols that work with free/cheap software. Yeah, you can use a web browser on this network, but you get to browse pretty much the web pages on the amateur network.

I don't know why people assume high speed data over amateur radio means an influx of people wanting to use the Internet. Lots of college age kids have become quite knowledgeable about microwaves and RF by experimenting with their 802.11 wireless gear. I see no reason they couldn't do this in the amateur bands because DXing, working SSB on 40 meters and all of that just doesn't appeal to them.

Or, you can let them do their thing, gain their knowledge and push amateur radio into further irrelevancy. I think we all know where the prevailing winds are blowing.

Hi Jayson,

An observation that is borne out here often enough, but equally so
with those who want to extend their cell-phone range.

>I see no reason they
>couldn't do this in the amateur bands because DXing, working SSB on 40
>meters and all of that just doesn't appeal to them.

This observation seems to both offer the question, and give the
answer. The rhetorical speculation that follows borders on redundant.

>Or, you can let them do their thing, gain their knowledge and push
>amateur radio into further irrelevancy.

Trying to force fit Ham radio into what "seems" to be their interest
(HF download of 30MB PDF files? By RTTY for hardcopy?) will rate a
goggle eyed response. This is about as successful as Bush selling
Social Security.

>I think we all know where the prevailing winds are blowing.
I've heard this dirge sung at wake rehearsals for more than 30 years.
Perhaps if we just pushed a pillow over the old geezer's face, then we
wouldn't have to wonder when.

Try something like new modes such as Amateur Radar, Amateur SETI
transmissions, or Amateur HAARP, or -gasp!- Amateur Broadcasting.

We get more broadcast pirates here than 802.11 or cellular, and across
the board the regulatory thumb is gouged into their eye with a
vengeance. Visitors might interpret this as though we had something
to lose ('cause we ain't gonna upset the FCC applecart coming to their
aid).

I think you can do a lot better than that. Put up some standard commercial piece of software that filters out known porn sites, etc., and get everyone to sign up with a valid call sign before granting them access, and go to town. Yes, the control operator is still responsible for people misbehaving, but I think a realistic viewpoint is that if you get people to agree to abiding by the FCC's rules and clearly have made some effort (with the filter software) to enforce rules, and immediately yank access from people who abuse the system, you'd be fine.

After all, it's not like repeater owners are forced to take down repeaters just because some yahoo doesn't follow FCC rules when using it, right?

There are a lot of people out there who seem far more concerned with the exact letter of the law than the actual intent...

> I don't know why people assume high speed data over amateur radio means
> an influx of people wanting to use the Internet.

I agree; I don't think it'd be a huge influx. Small, if anything. But a very satisfying change for those of us who WANT to use amateur radio and the Internet when we're mobile or otherwise out of the range of public WiFi access points. (About a month ago I started a thread on the Yahoo! digital radio group discussing the idea that you'd get WiFi at 'some megabits per second' when you're close to a lot of infrastructure, 'hundreds of kilobits per second' when you're working repeaters some tens of miles away in the amateur bands, and some 'tens of kilobits per second' when you're literally in the middle of nowhere using systems such as WinLink on the HF bands.)

> Lots of college age
> kids have become quite knowledgeable about microwaves and RF by
> experimenting with their 802.11 wireless gear.

Yes and no. I have seen some very impressive boards made by 'amateur WiFiers' out there, but realistically the most 'interesting' parts of a 2.4GHz ISM band radio is all on-chip, and I think you can count on one hand how many people have the ability to homebrew some RFICs in their basements or after standard working hours at their employers. Part of the attraction for me with amateur radio is that you can sit down and build a complete HF (or even 6m or 2m) transceiver a transistor at a time and have its performance be reasonable close to what you'd get from an off-the-shelf radio -- sometimes even better!

This just doesn't happen with WiFi. The majority of homebrew WiFi stuff you see out there is within the realm of digital (i.e., the projects use some chip that takes in RF and spits out bits -- no RF design necessary... in fact, a lot of the projects out there interface to a PCMCIA or PCI WiFi _card_!). While I think amateur radio is probably heading that way as well , performing analog design for RF processing is much more accessible in amateur radio.

Granted, you could argue that amateurs generally don't make their own transistors either, but my point is that the level of 'hacking' available to amateurs can go down to a much lower level than it can with WiFi. There's no such thing as the 'all discrete component Altoids tin WiFi project.'

I do think there are certain parallels in that the vast majority of people who are 'into' WiFi are just folks looking to _use_ the technology; they only want to learn enough about cantennas so that they can successfully link with their buddy on the other side of town; I think this is true with many hams as well... and there's nothing wrong with it.

> Or, you can let them do their thing, gain their knowledge and push
> amateur radio into further irrelevancy. I think we all know where the
> prevailing winds are blowing.

Having just returned from Dayton, I'm really not worried that amateur radio is going to become completely irrelevant any time soon. Not even in a couple decades from now. By then, I think the FCC regulations will have changed so drastically that it's pointless to discuss.

I have Kraus' book (the last edition printed! -- now that Dr. Kraus has died,
it'll be interesting to see if Ronald Marhefka releases another edition of
it?) and Laport's book from
http://snulbug.mtview.ca.us/books/RadioAntennaEngineering/. Is that the same
scan you have?

I tried to build a 2.4GHz helical antenna based on the information in Kraus'
book some 3 or so years ago now, but unfortunately it didn't work. Having
access to a network analyzer these days would probably improve my odds...!

Thanks,
--Joel

Saw an article where Google uses 3 languages routinely: C++, Java, and
Python.
(All 3 are object-oriented)
Special permission was needed for other languages
I think one reason for the OO movement revolves around the cost of
development.
Large projects -
with many developers of varying degrees of competence -
are easier to manage
using OO design.

If someone gives a coder a job like:
"write an instance method for xyz class which will take 2 int args and
return a abc class..."
he can go right to work. -and -
someone else can be coding a different method for the same class.

regardless of the language
when you code
you'll find some patterns
we all use
over and over
the difference is
syntax

Hal:

Java is buried in a lot of webpages... when it first got big use... I kinda liked all the flashy visual stuff it could do...
... then it started bogging down net speed, then the scriptkiddies started finding evil ways to hijack your browser and "trick" you into clicking on buttons which put bad code on your machine with Java--I dumped Java then--now I have run XP w/SP2 with SUN Java enabled and not been bothered with the malicious code--but once burned--twice warned--and I turn Java off most of the time... some forms demand it...

I am not against scripting languages, and perl is one of the first I learned--but since I write in C, Java is no problem--but I don't like the OOP part, it forces a lot of predefined functions/procedures and methods on you... luckily, we don't do any Java at the shop--it is too slow for our implementations of encryption/decryption... sometimes assembly is barely able to manage the tasks in real time... and that is important with voice/video communications...

Are you a programmer Hal? And if so, what is your language(s) of choice? And, are you a hobby programmer or have to try to get enough money to eat from your efforts (like me <grin>) ? My most fulfilling use of code is for personal use... I'd really quit my job if I didn't need the booze, cigs and loose women (well, something like that <grin>)

Warmest regards,
John

Dave C:

Gee, that is too bad... probably quells diversity in what is available to
Mac users... bummer man!

But, you remind me how lucky windows users are with the IBM open platform of
the PC hardware and how anyone can pick up a book, learn a bit of
programming and we can yet have another alternative to the many we have to
pick from...
I do feel for you Mac users, how about putting Linux on your Mac box? That
would open up new horizons for you... <grin>

Warmest regards,
John

It's spring cleaning time (she says), so I'm selling some amateur radio items (assembled Ramsey kits, HTX-100/HR2510 parts radios, and AMSAT-UK/NA items) at a tiny fraction of their original price. Here's a link to my items:

http://search.ebay.com/_W0QQfrppZ50QQfsooZ1QQfsopZ1QQrdZ0QQsassZwbblair

Hmm.
I suppose that for largish low frequency components in the signal, you
might also get the cable bits physically moving, both together, and in
relation to each other, which might screw up the impedance a little.

Are they big wheels, i.e. 3 full wave loops in each big loop or simply one
loop?
You may want to consider whether you will use a power divider or a phasing
harness.

My old 2 meter big wheels (3 full waves) use a phasing harness and are set
48 inches
apart.(about 5/8 wavelengths). It uses a phasing harness with the coax
going to a center point, splitting into an upper and lower leg. The upper
and lower legs then split again and go to the upper two antennas or the
lower two antennas.

Regards,
Ed, N5EI

3469. Simple Match for Inverted L 80m?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-28 11:49:15 UTC
From: hasan schiers <schiers@netins.net>
Message-ID: <d79lrq$i9e$1@news.netins.net>
Source record: 76384

This is a source run for an inverted L antenna for 80m that is 43 feet vertical and 23 feet horizontal.

What would be the simplest matching network to use to produce a flat match. My primary use would be 80m low angle work at 3.7 and 3.5 Mhz, but also want to be able to use it (with a tuner, of course) for a local net at 3.97 megs.

While a 1.7:1 vswr at resonance is usable, I would like to get my starting point as low as possible to maintain some sort of reasonable vswr at the band edges, for those times when I need to check into the net.

By simple I mean no caps...they are not all that easy to find (in a hurry) any longer. I need power handling of 500w. My two thoughts are some sort of 1/4 wave transformer (although that's a lot of coax), or a simple toroidal transformer.

Any suggestions? Core material for the toroid (including availability), turns ratio, etc? Or is a toroid a bad idea for this app?

TIA,

...hasan, N0AN

EZNEC ver. 3.0

Vertical over real ground 5/28/2005 6:39:29 AM

--------------- SOURCE DATA ---------------

Frequency = 3.71 MHz

Source 1 Voltage = 29.15 V. at 0.61 deg.
Current = 1 A. at 0.0 deg.
Impedance = 29.15 + J 0.308 ohms
Power = 29.15 watts
SWR (50 ohm system) = 1.715 (75 ohm system) = 2.573

Well, you can make it a little short and add a base inductor to tap to get the high end of the band, or you can make it a little long and shorten it with a variable cap.

Thanks Harold, but that's not what I'm trying to do. I'm not trying to broadband the antenna...I'm trying to simply match it...so that starting out at 1:1 instead of 1.7 : 1 will broaden the 2:1 vswr points a bit. I'm going to use a tuner on the band edges anyway.

So the only question is:

Simplest way (without caps) to match 29 ohms to 50 ohms at the feedpoint.

Here is how it is done at 2 meters, you should be able to work it out for
the lengths as the spacing is given in wavelengths. They are about 1.5 meg
for each file.

hasan schiers wrote:
> Any suggestions?

For single-band operation, an autotransformer comes to mind.
Wind a coil with about 12 microhenries of inductance. Transmitter
output goes to the top of the coil. Ground goes to the bottom.
Tap down from the top on the coil for the antenna feedpoint.
The transformation ratio is roughly equal to the square of the
turns ratio.

Hi all!

my excuses if this is kinda of topic but allow me to ask you experts this question.

Last week, a friend asked if I could fix him up with a "portable" antenna for TV reception. He actually wants a portable antenna to use with his portable computer, which contains a UHF receiver.

I already had this idea of making a groundplane receiving antenna out of a connector (N-connector) and cutting the elements down to the exact size for 600 Mhz but this seems a stupid idea because the antenna is not solid at all!

Does any of you have any suggestions?

73s
Pete

Hi hasan, If you don't want to use capacitors in your matching
circuit, just shorten the antenna a couple of feet. That will add some
capacitive reactance at the frequency of interest. Then you can use a
shunt inductor to get a 50 ohm match. What you will really have is an
"L" network with a series cap and shunt inductor. You tune the
capacitor by changing the length of the radiator, and tune the inductor
by adding or removing turns.
An example, if you shorten the antenna until the impedance is around
29-j25 at 3.71mhz, a 2.5uH shunt inductor will give a 50 ohm match.

First of all, changing the match doesn't make the antenna change from
a "low angle" radiator to a radiator for local work.

You can use a 1/4 transformer of two parallel RG-59 to get a nearly
perfect match at 3.7 MHz. But, you must realize that by doing this
you actually *increase* the SWR at the band edges. Any reactive
solution will do the same.

If you have a tuner anyway, I fail to see why you want to do this.

3480. Screwdriver antenna suggestions

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-28 16:17:20 UTC
From: "Joe S." <nobody@nowhere.net>
Message-ID: <d7a5ia01u2g@news2.newsguy.com>
Source record: 76395

I'm looking for experience and suggestions about screwdriver antennas for my Yaesu FT-857D.

What screwdriver antenna are you using?

How simple is it to operate?

What connections are required?

How rugged it is?

How long is it? (I will mount it on a mount attached to the ladder rack on my truck, so, the base is 6 feet above ground to start with.)

The Yaesu ATAS-120 is simple -- program the rig so it knows the ATAS-120 is connected, hit the TUNE button, and it tunes. I really don't want a screwdriver antenna that requires me to mount two or three more switches in the cab of my pickup, run a additional 12VDC line, and then push the mic button, flip a switch, turn a knob, and watch two meters at 60 MPH while the thing tunes.

Thanks for your comments.

My 18th edition should be worth much more as it is unique.
It fell off my motorcycle one day and by the time I retrieved
it, it had been run over by a dozen vehicles. :-)

Since most of the voltage appears at the ends of antenna elements, you
want to keep supports away from the ends. It would take some test
data (or simulations) to determine how placing elements, say, on the
surface of a circuit board, instead of rods suspended in air would
alter the resonant lengths and optimum spacings.

Your welcome! I can see that like me, you abhor wading through umpteen lines of old info to see what has been added. In the 110/300 baud days, folks knew how to edit a message to the essentials and bottom posting made sense.

Today with an entire eight hundred line message being quoted, simply to add "me too" obviates bottom posting. Thank you for your positive comments.

Yep, Applets gave Java a head start.
But now I don't think applets are being used very much.
Full blown applications (like Star Office and 'Open Office.org)
is the typical Java program now.
Now everyone is trying to get their programs web-enabled.
Yep - I'm a programmer. and a student - and a teacher
The more I learn, the more I learn that there's more to learn.
My ignorance becomes more obvious to me as I learn.
The push now is to make legacy apps web-accessable -
or to replace legacy code with web apps.
Java servlets and Java Server Pages (As opposed to Applets) seems to be the
wave of the future.
I don't have a favorite language until I see the environment and
requirements.
But I do have 'least favorites' (C# and dot-net in general)
your description of scriptkiddies causing you to 'dump java' is a shame

But It still sounds like you're getting JavaScript confused with Java.
Since you program in c, it makes sense that you don't like OO.
Object-Oriented programming is quite a departure from the procedural world
of c.
Its a different programming philosophy.
And to top it off - they're coming with a new one called "Aspect-Oriented
Programming".
We'll see if it stands to test of time.

You mentioned "Java applet" for instance... its' counter part in the "real world" is a dynamic .dll, binary code called and executed as needed... it really makes no sense in renaming a dll to "applet." Why this "floats" and is claimed to be "revolutionary" is beyond my understanding--I chuck all such things into the "obfuscation bucket." And, think the ones doing this have just run out of fresh ideas so are reduced to BS to try to cut out a position for themselves...

Cynical is my middle name, I forgot to tell ya that, "John Cynical Smith." <grin>

Warmest regards,
John

first, scriptkiddies are not 'coders', they are idiots who only know enough
to run scripts that they download from hacker sites.

second, java is a language and it is definately not a 'scripting' language.
it is a full featured high level language. you might be confusing java with
javascript. javascript is completely different and should never be
mentioned in the same sentence with java.

finally, there is no one that works in c++ who wants to rename it java, they
are very different things. however, c# is microsofts attempt to merge c++
and java, likewise vb.net is their attempt at merging vb and java. how well
it works is still being worked out i think.

Yep, Applets gave Java a head start.
But now I don't think applets are being used very much.
Full blown applications (like Star Office and 'Open Office.org)
is the typical Java program now.
Now everyone is trying to get their programs web-enabled.
Yep - I'm a programmer. and a student - and a teacher
The more I learn, the more I learn that there's more to learn.
My ignorance becomes more obvious to me as I learn.
The push now is to make legacy apps web-accessable -
or to replace legacy code with web apps.
Java servlets and Java Server Pages (As opposed to Applets) seems to be
the
wave of the future.
I don't have a favorite language until I see the environment and
requirements.
But I do have 'least favorites' (C# and dot-net in general)

your description of scriptkiddies causing you to 'dump java' is a shame

But It still sounds like you're getting JavaScript confused with Java.
Since you program in c, it makes sense that you don't like OO.
Object-Oriented programming is quite a departure from the procedural world
of c.
Its a different programming philosophy.
And to top it off - they're coming with a new one called "Aspect-Oriented
Programming".
We'll see if it stands to test of time.

an applet is not like a dll. a dll is not meant to be a complete program. it is a library that provides function for some other program to use. an applet is a full executable that can be run by the jvm.

"John Smith" <assemblywizard@gmail.com> wrote in message news:S15me.120$xX7.7244962@news.sisna.com...
You mentioned "Java applet" for instance... its' counter part in the "real world" is a dynamic .dll, binary code called and executed as needed... it really makes no sense in renaming a dll to "applet." Why this "floats" and is claimed to be "revolutionary" is beyond my understanding--I chuck all such things into the "obfuscation bucket." And, think the ones doing this have just run out of fresh ideas so are reduced to BS to try to cut out a position for themselves...

Cynical is my middle name, I forgot to tell ya that, "John Cynical Smith." <grin>

Warmest regards,
John

3494. HF loop antenna and angle of wire

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-28 23:03:28 UTC
From: "Chuck W." <cwyatt@w3minds.com>
Message-ID: <1117321408.603999.67120@z14g2000cwz.googlegroups.com>

I've been working on a horizontal loop, about 210 feet of wire. I've read that the shape isn't particularly critcal. That's good because my yard isn't anything close to symmetrical!

Anyway, I've got one angle where the wires are coming together at an angle that is somewhat less than 90 degrees. If you can envision a classic "kite" shape, that's about what I've got. When I try and plot something like this with EZNEC, I'm seeing these really pointy, jagged looking lobes on the 2D Elevation plot, and I'm not sure what that means.

Thoughts?

Thanks,

Chuck

AH - a fresh perspective. You tell him, Dave!
Java has a good reputation as a development language.
JavaScript is completely different.
VB dot-net (like you said) is beginning to look a lot like Java.-
I'm glad I'm not the only one that noticed that).

Dot-net will unfortunately catch on - because it is M$.

Here is quickstart page for getting an overview about dot net--another scripting languge which uses c type syntax...
http://www.codeproject.com/dotnet/DotNetScript.asp

You know, you can write webpages in "C", as long as your page supplier provides support for C executibles... run a hundred times faster or more though... script is good on free webpages though--they usually will not trust you with c executables running on their free machines--for that--you have to pay...

Warmest regards,
John

3498. Impedance of pull-up whip on SW Receiver?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-29 03:35:59 UTC
From: John Smith <assemblywizard@gmail.com>
Message-ID: <LMame.163$0o.10684484@news.sisna.com>
Source record: 76413
Cross-posted to: rec.radio.amateur.antenna,rec.radio.shortwave

I have a Grundig YB-500 (Yacht Boy 500) shortwave portable. I frequently take it to remote locations with me and have enjoyed the radio for years. It has a short pull up whip antenna, all I have done in the past is to slingshot a long wire into a tree and use a clip lead to attach it to the pull-up whip (no external ant connections on the radio).

I was wondering what the impedance the collapsed whip would present, and what sort or a balun/auto-transformer could be used between a longwire (or other ant), gnd and the pull-up whip to improve reception...

... anyone ever done any experimenting or unique ideas?

Warmest regards,
John C. Smith

Hi Brett,

Depends on the frequency. EZNEC would answer that in a heartbeat.
Given your preference for backing into problem, at 10MHz, at 1M in
length, 1 - J 1Kohms.

>what sort or a balun/auto-transformer could be used between a longwire =
>(or other ant), gnd and the pull-up whip to improve reception...

Aw c'mon now, Google will give you this in another heartbeat.

Hmmm, I have googled Richard... but not found anything other than standard baluns/auto-transformers and all too boring methods of using them... and yes, I could go expermenting on my own with these--was mainly hoping someone has walked this path before and already gleaned the best method, or at least could get me ranting, raving and thinking!!! <grin> My bark is MUCH worse than my bite yanno....

I didn't mean what the capacitve reactance of the pull-up whip was--itself, I meant to mean the input impedance which the input at the bottom of that whip expected to see...

It seems obivious they have provided some +J Ohms just past the bottom of that whip (or maybe not?)... however, input be high impedance and 1K+ ohms--and some non-reactive load could be assumed to be expected by it?

Warmest regards,
John

Well, leave it to me--said that all wrong and only caught it on the
re-read--which--naturally--I did AFTER posting...

I should have made it apparent that whatever ant I hook to it, will, of course--have to
mimic that capacitive reactance you mentioned...

Warmest regards,
John

If you see pointy, jagged-looking lobes, decrease the plot step size.
That's the "Step Size" selection in the main window.

And you had to post a 170 line message to pass on 4 lines of
information? This goes from boring to lazy.

The capacitive reactance comes free with the whip.

You will drum up a 100 responses on what's better - what is odder is
that all those great ideas haven't become ordinary after 50 years or
more. And after, what, 17 - 18 years? no one's figured out how to
power NYC with a Zippo's full of cold fusion either. Strange thing
about invention - doesn't seem to work all the time (or worse,
anytime).

Sorry to disappoint you John.

Nobody has ever made a significant improvement using aligator clips, lengths of wire and baluns on a portable whip receiver. Except, if lucky, merely by chance on one band at the expense of the others.

You may, however, hear a bunch of claims, e.g., by CB-ers and plagiarising old-wives, based on imagination and wishful thinking.

Signal to noise ratio is what matters. And that's an uncontrollable function of the incoming signals and noise. the ionosphere, and of the receiver itself.

However, it's quite interesting to experiment with longer antennas. Obtain a circuit diagram of the receiver and try to predict what will happen - if anything.

A most elementary circuit analysis is all that's needed. Otherwise you will be working entirely in the dark.

Clear your head and forget about a balun. You must have been reading the wrong magazines articles. You are dealing with an unbalanced-to-unbalanced, very high impedance-to-high impedance situation.

Consider a ground conection to the receiver chassis. This lowers the impedance to more predictable values. OK if you are located conveniently near to a domestic plumbing system. But even a short rod in good soil will have some effect for either better or worse.

If you insist, signal to noise ratio MIGHT be improved by using a single adjustable LC tuned circuit as a pre-selector in conjunction with a length of wire and a ground connection of some sort. But it might have an adverse effect.

My guess is that you will end up with a new, Japanese, very expensive, battery-operated, communications-grade receiver at the end of a 100-feet length of 18-gauge magnet wire. Even if the wire is just strewn on the ground.

Wait a bit and Chinese, equally good, 1/2-price versions may become available.

Economics provide the foundations of all engineering. If you don't understand economics then you don't understand anything. Not even SWR or the portion of a dipole from which most of the radiation is supposed to occur.

Regards, Reg.

Cec, it seldom works. You forgot to mention the most important
parameter is the input impedance to the antenna.

For an analysis of an inverted-L or vertical antenna, plus tuner L and
C component values, download in a few seconds program ENDFEED from
website below. No unzipping inconveniences. Run immediately. Easy to
use.

Perfecto, Reg!

This is exactly what I was looking for ...but I had forgotten you had
written this little jewel.

I am a bit surprised at the small effect on losses in the number of radials
once one gets above 8 radials of 20m length.

I need to play more with wire size (confounded mm!)

Thanks again for your contribution of this program. 73

I didn't forget, Reg. The input impedance was given in the
original posting:

"Frequency = 3.71 MHz Impedance = 29.15 + J 0.308 ohms"

Assuming that is the input impedance, I think my advice was
reasonable. If I had to match 50 ohms to 29 ohms on a single
band, I would just wind an autotransformer.

==========

Cec, to prevent the transformer inductance from completely detuning the antenna, the transformer would have to be wound with a lot of turns on something like an E and I dust-iron core. It's not worth the trouble when there are other, more simple ways of doing the job.

The only advantage of a transformer or auto-transformer is that it will cover several bands or octaves with widely different antenna impedances.

Nice to bump into each other again.

Reg.

Yep, somewhere around here I have a tapped autotransformer
wound on a #2 powdered iron toroid designed for 75m use.
I wound it to be installed at the twinlead/coax junction
on a G5RV to obtain a 1:1 SWR on the coax on 75m. It worked
but I found that a parallel 1000 pf cap works just as well
and is easier to clip on and off.

Hasan, why should you be surprised? Have you been reading the
plagiarised old-wives tales in the magazines? ;o)

There's another more accurate program, RADIALS2, which may be of
interest, which deals with shallow-buried radials of any length and
number, in conjunction with a simple vertical antenna of variable
height just to illustrate the practical effects.

Download program RADIALS2 from website below.

information? This goes from boring to lazy.

The capacitive reactance comes free with the whip.

You will drum up a 100 responses on what's better - what is odder is
that all those great ideas haven't become ordinary after 50 years or
more. And after, what, 17 - 18 years? no one's figured out how to
power NYC with a Zippo's full of cold fusion either. Strange thing
about invention - doesn't seem to work all the time (or worse,
anytime).

I wish I had a dig cam which I could take a close up picture of the left side of my receiver--which I have had for probably 10 years, and looked at hundreds if not thousands of times--yet just did again (I am easily fooled!!!)--there is NOT an ant jack... perhaps there was on a later model than mine, but NOT on mine... how I have wished there were... <frown>

Warmest regards,
John

JS,
.
IIRC - The Grundig Yacht Boy 500 has an 1/8" External Antenna Jack
on the Left Side of the Radio.
http://www.satellit700.com/yb500/500f.jpg
- Headphone Jack
- Line Out Jack
- External Antenna Jack
(The Tip is the Antenna and the Rear Barrel is Ground.)
- DC Input 9V Jack
.
Why not use the 1/8" External Antenna Jack along with one of those
23 Feet Portable Roll-Up Shortwave Antennas with the 1/8" Plug ?
.

Aye Reg--economics rules the world... except my very own bench... and then it is my wallet and "tight a$$ nature"... I am little better than those buggers who want to keep all the money for themselves! <grin>

And, you are right again, I have been reduced to the humble L-tuner in the past... and it does work ok...

For the radio gnd, in the past, I used a modified plug into the "record" jack which is available, and use its gnd connection(from the gnd on that plug--which "seems" to actually be hooked to circuit board ground, special screws hold the back on the radio which I do not have a tool to remove (similar to an "allen wrench"--but different)--and never looked hard for one--or machined one,for the L-Tuner, however, a modest gain in performance seems to be realized by using a real earth ground, even to the point of being able to pull the radio ground while still realizing the benefit, and a modest adjustment of the L-tuner--I expect EXTREME impedance at the whip--even touching the whip degrades signal reception drastically--when other ant is hooked....

I simply measured the gnd I get from the "ground plug" I am using to the neg of the batteries, they are at the same level, and I decided to call that close enough to call gnd...

Warmest regards,
John

Sorry to disappoint you John.

Nobody has ever made a significant improvement using aligator clips, lengths of wire and baluns on a portable whip receiver. Except, if lucky, merely by chance on one band at the expense of the others.

You may, however, hear a bunch of claims, e.g., by CB-ers and plagiarising old-wives, based on imagination and wishful thinking.

Signal to noise ratio is what matters. And that's an uncontrollable function of the incoming signals and noise. the ionosphere, and of the receiver itself.

However, it's quite interesting to experiment with longer antennas. Obtain a circuit diagram of the receiver and try to predict what will happen - if anything.

A most elementary circuit analysis is all that's needed. Otherwise you will be working entirely in the dark.

Clear your head and forget about a balun. You must have been reading the wrong magazines articles. You are dealing with an unbalanced-to-unbalanced, very high impedance-to-high impedance situation.

Consider a ground conection to the receiver chassis. This lowers the impedance to more predictable values. OK if you are located conveniently near to a domestic plumbing system. But even a short rod in good soil will have some effect for either better or worse.

If you insist, signal to noise ratio MIGHT be improved by using a single adjustable LC tuned circuit as a pre-selector in conjunction with a length of wire and a ground connection of some sort. But it might have an adverse effect.

My guess is that you will end up with a new, Japanese, very expensive, battery-operated, communications-grade receiver at the end of a 100-feet length of 18-gauge magnet wire. Even if the wire is just strewn on the ground.

Wait a bit and Chinese, equally good, 1/2-price versions may become available.

Economics provide the foundations of all engineering. If you don't understand economics then you don't understand anything. Not even SWR or the portion of a dipole from which most of the radiation is supposed to occur.

Regards, Reg.

Not "mic level audio" (at the jack mentioned before), but a "switch" when the radio is turned on--will also, though that switch, turn on a tape recorder or other other device of your choosing... sorry, just realized that mistake and drug out the manual...

Try clipping the pull-out antenna to a ground rod.
For some reason, that seems to work better than a long slingshot.
I tried Slingshot -kiddie antennas once and found a ground wire works better
for portables.
;-)

Hal:

You embarrass me... I am a "slingshot kiddies" (kinda of did get tied up shooting a few rocks with the slingshot too--can't deny it--still a boy deep inside)... <frown>

... but hey, at least I am past the denial part! <grin>

That sounds weird, grounding the antenna, but hey, I am ready to be made a fool of in the pursuit of knowledge--it that's what it takes... I'll give it a shot! If it isn't all a "joke", perhaps the length of the ground wire can be manipulated to benefit... heck, I'll even slingshot a longwire over the tallest tree I can find and ground the other end!

Warmest regards,
John

Not that I advocate websuck of porn sites... However;

These tools rely on following links just as you would when you are web browsing. Porn sites often have user/password access that may or may not set a level of security that would make anonymous downloading some what more difficult. It kind of depends on how the developer has written their code. If for example the user/password combination only points you to a unrestricted URL not linked from the main/anonymous page then it is only a matter of using that URL in your wget etc session.

No doubt searching through newsgroups (google etc) would give you the pattern that the developer used and even with a series of for/next loops in the wget etc script. You could let it sit there for days on end going through all the possible alpha/numeric combinations of folder/filenames to get what you are after!

To give you an idea what is possible, I wrote some test code to extract a database from a website where the URL was of the form;

http://www.vv.gov.au/data/record?rec=104468

By using a for/next loop of sequential record nunbers and making the record number a replacable variable I would have been able to suck the entire database down. Useless to me mind you but all very possible.

What has been useful for me (keeping it OT) was that I sucked the entire http://www.cebik.com antenna website to my local drive so lookups and browsing is much faster. I periodically used the refresh/update feature as the website changes. Some may question the legality/copywrite issues of this but since it is for my personal use I doubt there is a problem.

Cheers Bob

He responded to your post that way because you are full of it. Most of what you posted is either wrong, off topic or unhelpful. Take your pick.

Just about anyone reading rec.radio.shortwave has connected some wire to a portable radio and gotten an improvement in being able to hear a weak signal.

About the only right, on topic comment you made out of a long post was about signal to noise being most important factor in the receiving antenna system.

AND...

I'm not somebody's old wife.

I'm not a CB'er.

I have a clear head.

I understand how BALUNs work.

I did not imagine it or indulge in wishful thinking and the improvement wasn't just by chance.

I'm not waiting to buy a Chinese portable.

I understand the economics of electronic engineering.

Since most of your 119 line post is pure disregard for anyone else's experience or opinion I may have missed some.

If you can't make a non condescending on topic post then go away please.

Hi OM,

That was not me, and given that inaccuracy in reporting (says
something doesn't it?) makes the following suspect:

>AND...
>
>I'm not somebody's old wife.
>
>I'm not a CB'er.
>
>I have a clear head.
>
>I understand how BALUNs work.

>I'm not waiting to buy a Chinese portable.
>
>I understand the economics of electronic engineering.
>
>Since most of your 119 line post is pure disregard for anyone else's
>experience or opinion I may have missed some.

This last comment of course, is prophetic by example with an obvious
negative expectation. ;-)

>If you can't make a non condescending on topic post then go away please.

You guys are a crack-up, you have others which read this newsgroup, calling me Brett in other newsgroups... I give up, I have began answering to it... <grin>
I expect anyway now for the FBI to show up at my door with a complete list of aliases I have used in the past and begin an interrogation of me--with lights in my face and rubber hoses--in the back room... <grin>

... asking me if I know where Osama is... he's my dad yanno... <roflol>

Warmest regards,
John

Whatever Brett did to his posting apparatus, the text now falls off
the right edge of the screen (in an Agent reader), requiring back and
forth scrolling to read anything.

JS,
.
Take a look at the RF Systems AA-1 External
AM/MW and Shortwave Antenna "Adapter" that
is designed to be Hooked-Up to most 'portable'
AM/FM Shortwave Radios.
http://www.universal-radio.com/catalog/preamps/0902.html
.
A simple 4:1 or 9:1 Matching Transformer (UnUn)
built along the same lines should get the job done
and be cost effective.
.

I agree put it up it will work and work great!! I should know I've got one up, it's called a Full Wave Delta Loop for 80 meters. It's designed to be configured in a triangle shape or some what of a triangle. Although get it up as high as you can on one corner. Mine is up about 80 feet on one coner 65 on another and about 25 on the last. And I can hear lightning storms as far away as the Misssissippi River and I live on Vancouver Island.
From the West well Japan has some terrific lightning storms in the summer and I hear every one of them. This is the bad news, now the good news, I have never had a better antenna up in the air that performed as well. The Delat Loop is a very popular antenna in the mountains of British Columbia, Canada.
The only advice is to feed it in the center of the longest length, not at one of the corners like all will tell you and at all costs keep the feed point away from the point or angle that is less than 90 degrees (mine is about 36 at the point) and none of my angles have tow the same. I use an IC-706MKIIG with an AT-180 tuner and the tuner tunes it to a 1.1:1 and that's by a Bird 43.

Yes, some of those real old timers were/are right on... I have always found that the proof is in the pudding, when you are working with a received signal... all the BS disappears... either that signal does increase or it does not--you are suddenly stuck in the REAL WORLD--either one design, balun, turner, ant is better, or it is not... you cannot fool that receiver, it knows how many nano watts is available immediately at its' input, or not...

... while not always the case, it usually proves that an antenna (if it can handle power, etc) which is good at receiving a signal from a certain direction/spot on the globe--will also transmit a equally good signal back to that exact same place... assuming that the receiver has the exact expectations of impedance as the xmitter... with receivers that can be very difficult to tell...

... swr meters/devices, when they "just happen" to coincide with delivering max power to the ant, are a GOOD thing... and it does help if you forget about SWR and just gauge the results in how many tubes you are flattening or high power rf transistor you are replacing (it is best if this number starts out at zero and remains there!)... and you are right, if x-watts come in to the final, x-watts (subtracting watts lost due to efficiency losses, etc) must leave that same transmitter--else you have a nice little heater for the shack...

Matt Look at this Article http://www.hamtv.com/wheel.html .
They say That fed with equal lengths of coax from one of the OAL splitters
(Antenna Splitters
) will work. Look at the bottom of this page http://www.hamtv.com/oal.html
there are Splitter for 33cm.
And the antenna have to be Facing each other or they will cancel each other
out .
Look at (wheel2.jpg) at this page
http://home.earthlink.net/~ku4pt/images/.

Ok got to go hope this help you a little.

Actually, it may be, and it may have had nothing to do with that guy wire/ground wire you were visually looking at (well, not directly--and it serving as an antenna)... in the presence of VERY STRONG magnetic fields, rf fields can be dramatically warped and rf fields bent and focused... and, it is not uncommon to find hundreds of amps (in some instances thousands have been recorded), at a very low voltage, around such poles... but that is a whole different story which has not been investigated well yet...

Source record: 76232

It doesn't really matter much...Use whatever is thick enough
to stay up. 14 gauge is plenty. Solid is best overall, but
stranded is easier to work with, and survives kinks much
better. The only reason I call solid best, is I think in some
cases, stranded can cause BC-RFI problems when it gets
real old and starts to corrode.. May be a fluke, but my level
of bc-rfi keeps going up and up every year. This mainly
shows up on 160m receiving in my case...The only
explanation I can come up with is the deterioration of my
stranded antenna wire over time...I've heard of other cases
of this also...But.....Thats a long term deal....Overall, I use
whatever is handy, and 98% of the time, it happens to be
stranded. ..As far as power, it really doesn't matter, except
as far as resistance...You can run a KW into a magnet wire
dipole with no problems. #14 is plenty big enough...I've used
#12 on some antennas, and found it basically overkill...
Even #14 is hard to break and it's a good bit lighter than #12. MK

I'm sorta surprised you would need to match it, if it's a
1/4 wave...I think your match in the real world, would
be better than on paper...I've never had to "match" a
1/4 wave here, L or straight.... But.....if I did, I would
just slap the tuner inline...On that band, any mismatch
would have to be large to give a high line loss. That
won't be the case for you just going from one part of
the band to another...Also, you should be able to get
a better match than 1.7:1, just by tweaking the wire
length.

Hi Cal,
Go to Home Depot or Lowes and you can buy a 500 foot spool of # 14 for
about 24 bucks. Thats what I use and it works quite well. get the
stranded type it's stronger.

Some traveling-wave antennas are wired "directly" to
ground at the far end. We are dealing with distributed
RF networks, not DC circuits. A DC ground wire 1/4WL
long is usually NOT an RF ground at all.

If one installs artificial ground circuitry between the
radio antenna and the ground rod, one can either attenuate
the signal or not depending upon the settings of the
artificial ground.

If you want to use a language that is portable to any computer,
gives you GUI capability, and requires a minimum of tools, learn
HTML, CSS and Javascript. If you can program in basic and pascal,
then Javascript should be no problem. There are a million tutorials
on the internet that tell you how to use them together. You can design
your own graphic front end in HTML and talk to it with Javascript.
The most basic of tools required is a web browser and a text editor.
That's how I write all my web pages. If you want something better,
there are lots of free development tools and page templates. If you
only want your programs to be local, that's OK. There is no requirement
to put it on the net, but if you do want to put it on the net, it's ready.

#14 (antenna and transmission line) handles my 500 watts
just fine with SWRs ranging up to about 12:1. At 50 ohms
and 700 watts, your feedpoint current is less than 4 amps.
Nothing has broken since I switched to stranded copperweld.

==========

Use whatever wire gauge will support its own weight. For 1 Kwatt,
anywhere from 18 awg to 12 awg will do fine.

The RF loss in the wire is very slightly greater with the thinner
gauges, but not enough to be noticeable. In terms of signal strength
it is in terms of hundredths of a decibel.

I prefer solid core, ordinary magnet wire. The enamel covering is a
protection against attack from atmospheric polution. Wires last for
years and years in the British average sort of climate.

The so-called "stretch" in annealed, enamelled, copper wires is not
worth the trouble of mentioning. Just give the wire a good tug during
erection, you will feel it give an inch or so, and unless there's a
double hurricane it will remain the same length for ever afterwards.

Yeah, I briefly had an ionized path in the air for an antenna. It
extended clear from the top of the vertical to that big black cloud
passing by. It must have been really bad SWR, though, because my rig
turned into a cloud of glowing metal and silicon vapor, blew out the
window, and burned my eyebrows off.

==========

Hello Gary,

All my programs are written in Pascal. I use Borland's Turbo Pascal-6 compiler but I think all versions of Pascal, for practical purposes, are interchangeable.

I like Pascal because it is disciplined. It obliges the programmer to produce logical, straightforward, understandable programs. For example there are no GOTO statements as in Basic. There are few clever but ambiguous code-constructs which allow alternative ways of performing the same operations. It is difficult to misuse or pervert the language to take advantage of fortuitous circumstances in program structure. The programmer is not tempted to break the rules.

The DOS/Pascal/Windows combination allows programs to be produced as short, single, self-contained, executable binary files. They are also machine independent. All of which is convenient for both programmer and user.

There are disadvantages. It would be nice to have graphics and to be able to dump the screen to a printer with one hit of a function key. But I think such facilities would make programs machine dependent through their screen and printer driver software. I could be wrong.

Reg, G4FGQ.

I think I got it now Cecil, my newsreader kept changing and setting settings, it would keep turning back on html instead of plain text, and turn on a "stationary" back ground (pretty pictures)--it would just ignore sending the message in plain text... a file msfix.xml had set an "email template" to do this, I have two outlooks, reg outlook and outlook2002--because on installing office XP, one sending though another--won't bore you with more details--deleting that file cured it... I think I picked up something from my "fans" which email me... it happens and I learned something... <grin>

Warmest regards,
John

Assuming I have an antenna that is perfect on 3.8 MHz. Perfect being defined, as I am feeding it with exactly 1/2 electrical wave length of 50 Ohm feedline and it is 1:1 SWR measured at the source end.

What would the SWR be if I substituted the 50 Ohm feedline with a 1/2 wavelength of 72 Ohm feedline?

The head of the pin is now open for dancing...

Hi Fred, It would still be 1:1. Doesnt matter about the characteristic
impedance of the transmission line as long as you use 1/2 electrical
wavelength.

You are just one of a small group of people that occupy a few newsgroups
at everyone else's expense. If you don't think the small click of people
you belong to does not drive other people away from contributing to the
amateur news groups you have a big surprise coming.

I'm not interested in "dealing" with obnoxious people like you.

Years and years ago, they used to make a heavy copper plated steel ant wire, anyone remember it? It was great, took years of abuse, snow, ice and high winds at a cabin of mine in the high sierras (11,500 ft elevation) and, like a timex watch, kept on ticking...

Hi Fred,

Assuming that when you say the antenna is 'perfect' with a 1:1 SWR on a 50-ohm line it means that the input impedance to the line is 50 + j0 ohms. Since the line is 1/2 wl,and presumed lossless, the terminal impedance of the antenna is also 50 + j0.

However, when you replace the 50-ohm line with one of 72 ohms the SWR on the line changes from 1:1 to 1.44:1. But since it's length is 1/2 wl the input impedance is still 50 + j0 ohms. The 1.44 SWR results from the 1.44 mismatch between the 72-ohm line and the 50 + j0 ohm impedance of the termination, the terminal impedance of the antenna.

The 1/2 wl consists of two 1/4 wl lines in series. At the point 1/4 wl toward the input the line impedance is transformed up to103.68 + j0, (72 x 1.44) which is then transformed back to 50 + j0 (72/1.44) along the 1/4 wl section returning to the input of the line.

Walt, W2DU

To all:

Since we seem to be picking up a pascal programmer or two-I might as well toss this out and see if anyone is interested:

R. Nelson-WB0IKN, apparently, contributed/wrote an article back in January 1985 issue of "Ham Radio."
Anyway, I ended up with some source code of his to compute a gamma match for a monopole/dipole-it is written in basic, and runs in "GWBasic" (you can get a copy of GWBasic off the net if you wish to run his original source-or use a method of your own.) I have the source at:
http://blake.prohosting.com/mailguy2/gammabasic.txt

I did a bit of work in translating his source to pascal, and it is in two files there:
http://blake.prohosting.com/mailguy2/gg.txt {a pascal .tpu unit to be used by the main program }

and:
http://blake.prohosting.com/mailguy2/gamma.txt {the main program}

. this source is mainly a debugging shell to get his formulas/calculations converted to pascal's method of handling math.
. the source compiles and runs. and seems to end up with the same values as his source. the code is FAR from finished and is a starting point. but can be used quite effectively to test the concept.

. there is an error if "driven element diameter = gamma rod diameter = gamma rod spacing".. It is a divde by zero error. since a square root of a variable is attempted and of course NOT allow and generates the error. his original code does NOT suffer this error-because of a "buggy error" in gwbasic-it allows the square root of zero, apparently!!!! (he started working with imaginary numbers it seems!)

. anyway, those interested can take a look at the source and see if it is of any interest to them-be great if someone would get it into good working shape and have Reg put it up to share with all interested.. I just have about a dozen other things on my plate right now and can't get to it immediately-and would rather translate to "C" anyway.

. it would be interesting if anyone has any good info on design of gamma matches and could share that with me-I'd like to study the formulas and hear descriptions of the calculations-as here I have only translated them-if anyone has such, please let me know. R. Nelson, or course, should be given credit for having provoked these manipulations of his original code.

. my debug code only considers the monopole, the dipole option would
need to be added, but is a simple calculation or two which can be seen
in his original basic code.

. if I can help with any others efforts, in any way, just let me know.

Warmest regards,
John

This is a good illustration of one of Reg's hot buttons -- that "SWR meters" don't actually measure the SWR on a transmission line, but rather are reporting the degree of match or mismatch at the meter's insertion point.

In the case of 50 ohm line, it turns out that the "SWR" reported by the meter is actually the SWR on the 50 ohm transmission line, assuming that the meter is designed for use in a 50 ohm system and reads properly in that environment. When you substitute the 72 ohm line, the SWR meter will still read 1:1 because the impedance at its insertion point is still 50 ohms, but the SWR on the 72 ohm transmission line is actually 1.44:1. So the answer depends on what you mean by "what would be the SWR":

The SWR on the 72 ohm transmission line will be 1.44:1
The SWR meter will read 1:1
If there is a 50 ohm line between your rig and the 72 ohm line, its SWR will be 1:1.

"The head of the pin is now open for dancing..."

... ahhh, missed this, so you now much choose:
1) I am going to use this for a practical application--so I really don't care how it works (like time)--I simply need something which works and functions on a equiv to a 1:1, frequency specific, voltage transformer.

2) I want to debate the physics of one-half wavelength lines.

... since my basic motto/bmod (basic method of operation) is "whatever works!" ... my choice is clear... <grin>

Warmest regards,
John

You are just one of a small group of people that occupy a few
newsgroups
at everyone else's expense.

You are as full of crap as a xmas turkey.

If you don't think the small click of people
you belong to does not drive other people away from contributing to the
amateur news groups you have a big surprise coming.

I don't belong to a "click"....I'm a big boy. I'll laugh at
your goofy ass all by myself. I don't need others help.

I'm not interested in "dealing" with obnoxious people like you

Good. Crawl back in your telahole, and I'll let you know if I
need to hear from you again. Jeez....What a preenus....

Doesn't sound very efficient. However any random chunk of a conductor will
work as an antenna at all frequencies.

Uhhh, Reg:

There ARE goto statements in borland pascal (don't kill the messenger of bad news--as is done here so often)... you can, just, not "goto" outside of a procedure or function or outside the main code (your goto must remain local to the code block it is instituted in)... I can supply you with a quick piece of example code if you wish me to....

Warmest regards,
John

>subject.

So they can discover some knowledge and use it to make
products or predictions, but if they cannot explain it in
non-mathematical terms to your satisfaction, then, by your lights,
they do not understand it?

As a counter example, consider the comments of Richard
Feynman. When he was awarded a Nobel prize for his work in (I believe)
quantum electrodynamics, he was honored at a luncheon provided by the
faculty wives at his university. During the proceedings, he was asked,
"Doctor Feynman, could you let us know, in simple terms, what your
work was about?" He answered, "Madam, if I could explain it in simple
terms, they wouldn't have given me the Nobel prize for it." Will you
contend he didn't understand his subject?

In addition, you fail to understand that discovering knowledge
and teaching it are entirely separate gifts. Some who understand
deeply are incapable of teaching. Others, with less than complete
understanding, can teach effectively, while being incapable of coming
up with the knowledge in the first place.

One of our most poisonous (and arrogant) sayings is the one
which states, "Those who can, do; those who can't, teach." It's not
all that common to find people who can do both well.

> It is also true that such complex subjects cannot be fully
>understood without in-depth math (Which is something I wish I had).

Wherein you contradict yourself. You can't contend at the
samer time that a knowledge of mathematics on the part of the learner
is a necessity at the same time that you indict the one who can
explain only in mathematical terms for lack of understanding.

Heads or tails?

FWIW, I'm feeding with about 60 feet of window line to a 4:1 balun and
then to about 80 feet of Coax. My plan is to replace a good bit more
of the coaxial line with the window line when I get around to it.

My assumption is that this set up would be best for multi-band
operation.

73,

Chuck

The SWR on the 72 ohm feedline would measure 1.44:1. You do
have an SWR meter calibrated for 72 ohms, don't you? :-)
Your 50 ohm SWR meter will measure 1:1, but as Reg says,
it is merely measuring the degree of match to your
transmitter designed for 50 ohm loads.

Without a ground connected to a battery-operated portable receiver,
for example via the earphone socket, the input impedance at the
antenna socket is umpteen thousand ohms.

So it doesn't matter very much what you do about the whip.

But you knew that before you asked the question. So why ask it? ;o)

I would guess, in your younger days, you were a gifted, over-active
little boy who asked questions with a motive always different from the
obvious one.

It is indeed a very useful technique for gaining information about
which the subject may be reluctant to divulge. Perhaps you should have
been employed as a WMD inspector to discover that none existed years
before Saddam confessed that he never had any and had never possessed
the facilities to manufacture them.

But it's a dangerous occupation. The senior British WMD Inspector
committed suicide shortly after blowing the whistle - or so the story
goes. ;o) ;o) ;o) ;o)

Whilst on the subject of whip antennas you may be interested to run
program WHIP_1 which analyses performance, from transmitter to
receiver input, of a typical vehicle-mounted whip + un-un transformer
+ coax line + receiver.

Years ago (like about 2 yrs) and even today (like now)
Copperweld makes it.
I have some 300-ohm transmission line made from copperweld conductors.
Look into the belden catalog and anywhere you
see the "Copperweld" trademark uses copper-coated steel.

interesting.
what's the diff if
source was in Pascal, C, C++, VB, GWBasic or whatever.
A miniscule difference in execution time at best.
Today's computers are fast. - (faster than most slide-rules).
Some of us script-kiddies would translate it for the fun of it.

It was stipulated in the original post that the swr was being
measured at the source end for the 50 ohm line. If all one changes is
the impedance of a 1/2 electrical wavelength line, and nothing else,
the answer is 1:1. Did not say anything about measuring the swr
anywhere but at the source. Whatever the antenna Z is in the 50 ohm
example that gives a 1:1 match, determines the swr bridge
characteristics. If the antenna Z was 72 ohms, then the bridge is 72
ohms for a 1:1 match. Change the transmission line to 72 ohms, still a
1:1.

Hal:

Good to know they still produce a good product...
I have given up the finer wire here, strung very long ants using steel fencing wire (like used in regards to chain link fence--or even large dia stainless steel wire from welders outlets in rolls--but EXPENSIVE!) run through 1/4"+ copper tubing these days--get all of at Lowe's or Home Depot... something about pumping big watts into a thin wire which just "itchs" my eccentricities... <frown>

Copper tubing can be had for scrap prices at a large recycling/metal scrapping yard near you... sometimes a guy is even lucky enough to find the steel wire to run through it for a few cents a pound!

In fact, many good aluminum/copper/stainless flats, rods, tubing, etc can be found for antenna projects... yellow pages should provide anyone with a source...

Warmest regards,
John

Nope, not if a 72 ohm SWR meter is being used. An SWR
meter calibrated for the transmission line Z0 of 72 ohms
will read 1.44:1 even if the 50 ohm transmitter is happy
with the 50+j0 ohm virtual impedance being presented to it.
I have SWR meters calibrated for 50, 75, 300, 450, and 600
ohms - doesn't everybody?

Please note that it was ***NOT*** stipulated in the original
post that the SWR meter was calibrated for 50 ohms. "What is
the SWR?" was the question.

Hal:

I don't even know where to start with that question--however, since GWBasic worked as a "basic interpreter"--the speed difference between that code and pascal could be compared to a baby crawling and the speed of light!
However, here that is almost a moot point--speed is not important and the code is simplistic... and not demanding of processor cycles of execution...

The reason to translate it to pascal or "C" is so it could be included into a larger antenna program--an example, not "C" of course, but fortran for example--would allow it to be included into a program such as EZNEC....

My gawd man, the possibilities are as limited as ones mind!!! ... well, in some cases---that is rather limited, isn't it? Course, none of those guys here... <grin>

Warmest regards,
John

SWR meter reads 1:1 at the source with 50 ohm line, that will tell
you that the swr bridge Z and the antenna Z are the same initially (1/2
wave line). Changing to 72 ohm line will still be 1:1.

VSWR stands for Voltage Standing Wave Ratio. It's supposed to be the
ratio of the greatest voltage on a transmission line to the least
voltage on the same line. On the line with a 72 ohm Z0, and a 50 ohm
load, there exists a standing wave, and the ratio of maximum to minimum
is 1.44 whether you measure it with a 50 ohm bridge at the beginning

or not. If you define SWR as what a 50 ohm SWR bridge measures, you
haven't quite grasped the concept.

==========

Yes, I'm sure you could descecrate the language for no useful purpose if you wished.

The fact is there is no GOTO statement in Pascal. It is not needed.

Only somebody with suicidal tendencies would deliberately convert a straightforward, logical, easily maintained, understandable program into a bowl of spaghetti. Every artificially concocted GOTO statement, another complicated part procedure, is a self-inflicted wound. Furthermore, it selfishly inflicts wounds on future maintenance operations. It is a symptom of lazyness and lack of intelligence on the part of the so-called programmer. One who is unfit to collect his wages.

If you want to be useful, write an internal, self-contained procedure in Pascal which will dump the screen to the printer on a single hit of a function key. Just like it is in DOS. No prizes offered.

Cec,

I refuse to be quoted as a bible on the subject.

It's bloody obvious to anybody who understands how so-called SWR meters work. It's simple enough even for CB-ers to grasp.

You will be pleased to hear I'm back on Sierra Valley, Californian Red tonight.

I'm having (but only temporary) second thoughts about the French stuff and Non's.

Reg, G4FGQ

Hi Tom, I know what VSWR means, but this example is not on the transmission line, it is at the source, and it is never removed from the source. We are talking about a bridge circuit at the source, so the defination of swr will have to be adjusted accordingly. (best match).

I was always under the impression that in order to have an SWR, you had
to have a transmission line to have it on. Of course, if you imagined an
infinitesimal length of 50 ohm transmission line between the bridge and
the actual 72 ohm line, you could make your point on that, but I think
many might think you were stretching things. I don't believe it's useful
to conflate the termination of a bridge with an actual SWR, but, who
knows, maybe someone more knowledgeable than I can make sense out of it.

3630. Re: Programming Language .... Ping Reg

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-31 00:35:40 UTC
From: John Smith <assemblywizard@gmail.com>
Message-ID: <BjOme.110$q_2.3680370@news.sisna.com>
Source record: 76099

Reg:

That nice looking, immaculate code you write, which flows with elegant logic, purpose and beauty... when the compiler gets it, changes it and spit a "whole bunch" of "gotos" in it... in assembly (which is what the compiler finally deals with) there are gobs of "direct jumps" using the assembly "JMP $????" instruction which transfers program execution DIRECTLY and IMMEDIATELY to code beginning at the address given ($????) (THIS is the DREADED goto--but really, it doesn't bite if ya know how to use it <grin>)....

... moot point however, as on the level of high level language a programmer can hide from this... HOWEVER, pascal, in the end, ends up just like 'em all, a binary program with gotos!... <frown>

Indeed, you could not execute code with out the binary goto--the first happens when any program executes... as a direct jump must be made to the binary program code which has been loaded into memory, and now must be JUMPED to, to execute....

But even worse, it is as I claimed Reg, look on the net using the search terms "goto statement" and pascal (use the double quotes too)... it IS part of the pascal language and can be used as I stated above...

However, let us move on friend, this is a silly argument at best, and credulous to spend any time at all debating--however, a programmer should know about it...

...and I support the NON-USE of goto in programs... <grin> goto is a sticky thing, later on you can trace bugs in code for days... and resolve that bug down to a goto!
You advise well, when you advise to avoid the DREADED GOTO!!!!
<nod-and-a-wink>

Very warmest regards,
John

That would be obfuscation. And you are correct, mostly in that perl resembles C, and sometimes does the same thing, and sometimes does not.

The reason it should be used for small jobs is that the number of tasks it is used for on systems tends to accumulate, and while none are normally an issue, many at the same time cron'd, are. For example, tons of mrtg jobs running at the same time, like I have a work. Hate them, but I don't have a replacement at this time.

And perl jobs that work, should be replaced by C or C++ compiled routines. Or compiled perl.

hello. I'm not a ham radio operator(yet) but was hoping I could still get some help here. A relative of mine stays at a rv campground close by me. Its maybe 2-3 miles if you drew a straight line from my house.

the campground is in a very low area. you drive down a hill for quite a ways and it has a lot of trees all down the hill. cell phones rarely work and break up when they do. I have tried a indoor 1/4 wave antenna at my house with murs while I setup a 1/4 wave antenna on their car at the campground and no luck.

Would I have any more luck on the cb frequencies? Anyway thanks for the help

One should be careful when using aluminum conductors for antennas.
ACSR (Aluminum Conductor Steel Reinforced)
may be a better choice for tensile strength.
but Aluminum oxide is an insulator. and it forms easily at the connections.
But I have made some good antennas out of Aluminum Arrows
I even left the fletching (feathers) on for a couple of antennas. :-)

It's possible - the lower frequency may diffract differently (and
perhaps more successfully) from the hilltops. It's probably worth
trying with some borrowed CB radios; I don't think I'd go out and
spend money on CB radios just to experiment.

The way I'd deal with a no-line-of-sight situation like this on the
2-meter band (frequency not all that different from MURS) would be to
locate some large landmark (preferably a large hill or mountain) which
is visible from both locations. I'd then aim a directional beam
antenna at it, from each site, and see if there was enough reflection
off of the mountain/hill to establish a useful communication link.

You'll probably need to get the antenna at your end of the link out of
the house - attenuation in the walls is likely to cost you a lot of
signal.

Thanks Reg, I had forgotten about Borland's Turbo Pascal. That's what
I used in a Pascal class back in the mid 80's. You're right about it
being pretty well structured, I remember the days of trying to

decipher some TRS-80 Model 1 basic and maybe the second or third line
would read goto 10000 <grin>

Thanks again.

Here is the original question again: "What would the SWR
be if I substituted the 50 Ohm feedline with a 1/2
wavelength of 72 Ohm feedline?"

Did he ask what would a 50 ohm SWR meter read? NO! He asked
"WHAT WOULD THE SWR BE ..." The SWR would be 72/50=1.44:1
on the 72 ohm feedline. That answers the original question.

CB will most likely work ok, seeing there's only 3 miles between you.
antenna height will make a difference.

3645. Homebrew G5RV Somewhat High SWR on 20

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-31 03:53:25 UTC
From: Gary
Message-ID: <74nn9154ll1pb5bein97gsv8rkuvdsl8gk@4ax.com>
Source record: 76109

I just constructed a homebrew G5RV, 51' on each leg, 32' 9" for the ladder line matching section.Then there's about 10 turns of RG8X in a 6" dia. coil for a RF choke. It's in an inverted V configuration. It seems to work well enough on 80 and 40 meters, but the SWR on 20 meters seems a bit high. It's 3:1 at 14.001 and seems to climb somewhat higher at 14.349. I made the matching section 32' 9" should I trim some off of the matching section, say down to 32' even or leave well enough alone ? I can tune it to 1:1 with my manual tuner, though the best the autotuner can do with it is about 1:6 to 1. I would like to have it resonant on 20 just because that was the band it was designed for IIRC.

>> It was stipulated in the original post that the swr was being
>> measured at the source end for the 50 ohm line.

He said, "WHAT WOULD THE SWR BE ...?" not what would a
50 ohm SWR meter measure. The SWR would be 1.44:1 on
the 72 ohm feedline no matter what the 50 ohm SWR meter
erroneously measured.

>> If all one changes is
>> the impedance of a 1/2 electrical wavelength line, and nothing else,
>> the answer is 1:1. Did not say anything about measuring the swr
>> anywhere but at the source.

Go back and read the question again, Tom. He asked:
"What would the SWR be if I substituted the 50 Ohm feedline
with a 1/2 wavelength of 72 Ohm feedline?"

Did he say, "What SWR would be measured?" NO!!!

Did he say, "What would the SWR be ...?" YES!!!

THE SWR WOULD BE 1.44:1 on the 72 ohm feedline.
You guys are not answering the question that he asked.

And Fred didn't ask what an SWR bridge would measure.
He asked: "What would the SWR be ... ?" You're right.
The SWR would be 1.44:1.

If the SWR climbs from 14 to 14.35, then the matching section
is too long and resonates the antenna system below 14 MHz. My
matching section is 29 feet on 14.2 MHz using "450" ohm ladder-
line (closer to Z0=388 ohms). But don't expect the get the
SWR much lower than 2:1 on 20m where the antenna is 1.5
wavelengths long.

OK CECIL!!!

Leave it up to you to pull the rug out from under me...
If I have a transmitter that has 50 ohm out, and it is going to hook to a 50 ohm cable (and I can't see how this coax is terminated) why would I ever choose anything other than a 50 ohm calibrated swr meter to measure it with?

Is that what I have seen on FS meters before (a rise in apparent radiation from the coax shield--and yet match looks good) and the 1/2 wave coax is really now part of the antenna?

And, if the meter didn't give me the right reading, and cooked my "BEEG LEENEAIR" could I sue the manufacturer, buy a yacht and live in the Bahamas, drinking Peter Vella Merlot? <grin>

Warmest regards,
John

Cecil:

I screwed that up... in the above, should have been...
"If I have a transmitter that has 50 ohm out, and it is going to hook to
a 72 ohm cable..."

The 72 ohm cable being t he only difference... and point being--don't I
only care I am presenting a 50 ohm load to the transmitter?

Warmest regards,
John

Hal:

I never thought about the aluminum shafts of arrows!!! The expensive ones are a titanium alloy--if I remember correctly... Make one tough antenna...

I have been lucky enough to get some titanium rod (or alloyed aluminum) before--at a scrappers, you sure can tell it when you attack it with a hacksaw, this was tempered, apparently, and had the properties of spring steel...

You are right, that anti-corrode stuff (gel/grease whatever that stuff is) is good to use on aluminum connections... I am in California--away from the coast--corrosion is not a very great problem here... but still every 5 years or so you do have to clean connections and redress...

Warmest regards,
John

Some of us want to know what the SWR on the feedline is.
That's how we calculate feedline losses. I get a kick out
of some ham saying, "I'm running a 66' dipole on 75m and
my SWR is 1.1:1." All that means is that the virtual
impedance at the tuner input is probably 45 ohms or 55
ohms. But what is the SWR at the output of the tuner
where it matters the most?

I won't presume to know what you care about. I care about
the SWR on my feedline. I have homebrew SWR meters calibrated
for 300, 450, and 600 ohms.

Ok, thanks Cecil. I suspected the matching section was too long
because as you said the SWR rose the higher I went in frequency. I'll
trim a foot or so off of it. Its not important but I don't know why
the autotuner can only tune it to 1:6 to 1 as I mistakenly tuned 80
into my 20 meter dipole with not much problem. Maybe the letters MFJ
have something to do with it ;)

Well I've found that even with the 400 page manuals there's always a question I have that's not covered. :(.... My favorite programming experience was assembler on a 8 bit 6502. That was about as easy as programming in basic. I can't imagine what programming a modern processor in assembler would be like. I suspect for the most part assembler on a P4 etc is a dead language.

> 73 Gary

Good Morning Gary,

You do not say what type of line you are using for the matching section.
you have to figure the Volocity Factor of the Line into your caculations..
So it should mostlikey be a bit shorter than 31 feet or so. Mine her with
homebrew 525 ohm line is 31 feet 2" , Why 525 ohm line because that was
about the same a Varney's original So his figures will change depending
upon the Line. Cebik has a good write up on the G5RV. at
http://www.cebik.com/wire/g5rv2.html
Have a good day 73 Dave

If you can tolerate TWO hits of a Fn key/mouse, Printkey 2000 will enable such, and works with Windows 9x/Me/2000/XP. The screen clip also can be saved as a gif, jpg etc and pasted into other windows programs, or attached to an email. The program is free.

Here is one download link:

Cecil, if I drank that much wine every day I'd believe the SWR at the input of the 72-ohm line is 1:1 too, but it ain't. I'm concerned with the guys who think it is. So please let me be totally elementary in explaining why the SWR on the 72-ohm line is 1.44 everywhere on the line, including the input, yet still has a 50-ohm input impedance.

Step 1. We have a lossless 50-ohm line of random length feeding a 50-ohm source to an antenna with terminal impedance of 50 + j0 ohms. The input voltage is 1 v and the input current is 0.02 a. Z = E/R, and 1/0.02 = 50 verifying that the Zo of the line is 50-ohms. The power absorbed by the antenna is IE = E*/R = 0.02 watts. The SWR is 1:1 everywhere.

Step 2. We now insert a lossless 72-ohm, 1/2 wl line between the antenna and the output end of the 50-ohm line. Does the power absorbed in the antenna change? NO. Do the forward voltage and current on the 50-ohm line change? NO. Are there any reflections on the 50-ohm line? NO. Are the forward voltage and current in the 75-ohm line 1 v and 0.02 a.? NO. Are there reflections on the 72-ohm line? YES. Is the input impedance of the 72-ohm line 50 + j0 ohms? YES. Is the SWR at the input of the 72-ohm line1:1? NO. Is the SWR at the input of the 72-ohm line 1.44:1? YES. Does the antenna still absorb 0.02 watts? YES.

Step 3. To understand why the input impedance of the 72-ohm line is 50 + j0 with an SWR = 1.44 we need to understand the voltage and current reflection coefficients, rho as well as the voltage and current transmission coefficients, tau.

Step 4. In going to a higher line impedance the voltage reflection coefficient rhoE is positive, and the current reflection coefficient rhoI is negative; The reverse is true when going to a lower line impedance, as when going from the 72-ohm line into the 50-ohm load.

Step 5. In going to a higher line impedance the voltage transmission coefficient tauE = (rhoE + 1) and the current transmission coefficient tauI = (rhoI - 1). The reverse is true when going to a lower line impedance.

Step 6. For an SWR of 1.44, rho = 0.1803. Therefore, when going from a 50-ohm line to a 72-ohm line, tauE = 1.1803 and tauI = 0.8197. Consequently, the forward voltage in the 72-ohm line is 1.1803v and the forward current is 0.02 x 0.8197 = 0.01639 a. Note that 1.180/0.01639 = 71.996, which would be 72 if we used more significant figures.

Step 7. When forward voltage 1.1803 v reaches the 50-ohm antenna load, the reflection coefficient 0.1803 x 1.1803 = 0.2128 v, which subtracts from the 1.1803 v at the input of the 72-ohm line, making the total voltage at the input 0.9675 v.

Step 8. When forward current 0.01639 a reaches the 50-ohm antenna load, the current reflection coefficient 0.1803 x 0.0.01639 a = 0.002956 a, which adds to the 0.01639 a, making the total current at the input of the 72-ohm line 0.01935 a.

Step 9. Dividing the total voltage at the input of the 72-ohm line by the total current, we get 0.9675/0.01935 = 50.01 ohms, the input resistance of the 72-ohm line with a 1.44:1 SWR on the line.

Step 10. Consequently, we see that the addition of the reflected voltage and current to the forward voltage and current yield an impedance at the input of the 72-ohm line that is 50 ohms, not 72 ohms. It is the effect of the 1.44:1 SWR on the line that has changed the line impedance (not the characteristic impedance) to 50 ohms.

I hope this helps in understanding why the SWR at the input of the 72-ohm line is 1.44:1, and NOT 1:1.

Walt, W2DU

Very good stuff, Walt, as usual. It is possible that Gary
misunderstood the question. He apparently thought the question
was: What SWR will a 50 ohm SWR meter indicate and of course,
a 50 ohm SWR meter will erroneously report an SWR of 1:1 at
the 50 ohm (current maximum) point on the 72 ohm feedline. If
we move the 50 ohm SWR meter to the 103.7 ohm (current minimum)
point on the 72 ohm feedline, it will erroneously report an SWR
of 2.1:1. But, on the 72 ohm feedline, the SWR is, of course,
1.44:1 at both the 50 ohm point and the 103.7 point and at all
other points up and down the feedline (neglecting losses).

Gary, the G5RV needs a tuner. If you wanted to operate on 14.3, trimming the match section to 25.7 feet would give you the best match. However it would affect all other bands and by definition no longer be a G5RV.

The above assumes you are using 450 Ohm Ladder line.

There are a few ANSI COBOL implementations for Win32. I use the IBM Visual Age for COBOL compiler for testing at work. It is very mainframe oriented, and even has an interface that allows you to appear to code in a Win32 IDE and it does the compile on a mainframe for you. IBM is also committed to Java/services integration with legacy apps and languages.

The famous one is MicroFocus, which has a lot of Win32 support, right down to all the Win32 APIs and .NET (don't laugh; COBOL was one of the first 15 languages that Microsoft supported in the .NET framework.)

There are others: just let your Googles do the walking.

If you meant "free-as-in-beer-and-speech" COBOL, then you are somewhat limited. The most useful is OpenCOBOL, but it fails many basic tests for COBOL-85, at least on the two machines I compiled it on.

TinyCOBOL is pretty stagnant, and there is a lot of other vapourware that seems to be infinitely stalled.

You can also download a free-as-in-beer learning edition of Fujitsu COBOL which is slightly crippled. It should work on XP.

Many "modern" BASIC implementations are compiled, at least to byte-code. This makes it more equivalent to something like Java. With a clever virtual machine design and today's fast systems it's hard to tell the difference between a traditional compiled-to-object-and-linked application and one that is compiled to byte-code and run in a VM or interpreter of some sort.

There is at least one BASIC system that will generate executables for Windows, Mac OS X and Palm OS from the same source, and on the same machine.

Dead languages are languages like cobol, pascal, fortran and basic--they
are still used, but out of main stream.

All professional implementation of C allow "inline assembly", you simply
drop an "asm" directive where you would like to switch to assembly and
begin keying in assembly code. When done, end your assembly block and
drop right back to C. Even turbo pascal allows this.... the compiler
and linker will just eat this up with no problem...

In the Linux world, one compiler and linker is able to virtually take
any language syntax and use it to compile and link binary code--it
doesn't give a rat's bum what syntax you are limited to write in--what
prevents that from happening out here in the real world is the need for
profit and to keep things proprietary--silly and very hampering... and,
made me have to learn a dozen syntax's over the years... I am not hung
up on syntax--and although I consider BASIC difficult in the fact it
obfuscates what is "really happening", cobol is worse... both are still
used, and microsoft would like to see everyone using "visual basic
scripting"...

I just don't fight the good fight anymore--will program in the language
which someone stands beside and is willing to defend with their life...
if the pay is good, the language is even better...

If someone suddenly "develops" a "new" and "revolutionary" language--I
guess I will grab a book and pick it up too... fact is, we have enough
syntax's need someone to come up with "real" ideas...

Warmest regards,
John

I applaud Reg for his defense of structured programming. That is what is taught in computer engineering whether using assembler level languages or higher level languages. In programming, spaghetti is bad.

Of course, at machine code level, a conditional branch includes what looks like a goto. Only a Californian troll would not understand that does not violate the idea of structured programming.

Well done Reg!

Source record: 76144

Sold for parts in one lot, a President 10 meter SSB/CW/AM/FM HR2510 transceiver and a Realistic HTX-100 10 meter CW/SSB transceiver (missing top and bottom cover but has mike). The HTX-100 powers up, but the synthesizer section doesn't work. Don't know anything about the HR2510 other than the fact that neither it nor the HTX-100 show any external or internal evidence of overheating due to major faults in the circuitry or applied voltage (i.e. no visible evidence of being catastrophically "smoked" through over-volt or cascade failure). The XMT power transistors on the HR2510 have been unscrewed from their heat sinks by a previous owner or technician unknown.

Mc Laughlin:

... religious wars over "structured programming", OOP, syntax, etc... always becomes the question, "Just how many fairies can I dance upon the head of this pin."

My coding directly relates to the VERY specific sliver of the industry I work in--encryption/decryption, in real time, of video, audio and text and other signals relative to purpose--and is both for security and size of data (data compaction) reasons and have transmissions/communications occurring at a high rate of speed....

If you attempt to do that in real time, with very highly structured high level languages only, and only written with regards to structure in mind--you will ALWAYS fail--there is no processor fast enough, there is no affordable way to build a product platform to execute the code on....

In college you learn the rules and how to "do it right"--but this is only so in "real industry" you can effectively break these rules and end up making a profit--the fairies dance the pin...

Take a look at just the testing shell I began to translate the code given here to pascal--you will find it is indeed structured--that is because speed is of no real importance and I am only concerned about making it readable to others...

Warmest regards,
John

> Ed K7AAT
>

Ed,

Had a major case of memory corruption - my coax is RG-58, not the larger 8X ;-). I think I'll admit defeat and just find a way to shoehorn another coax up the mast. Maybe I'll just drill thru the cabintop and epoxy a stainless threaded SO-239 nipple thru it so the balsa core of the fiberglass won't suck up moisture like a sponge. Then just make another run up the mast.

The problem with drilling a larger hole in the mast step is that it's harder to seal against moisture when you have lots of cables in a relatively large hole. Water inevitably gets in...

One more thing:

You can drop "mathix" from the uses statement--it is a 3rd party math
lib I thought I needed, but wrote the code internal to the code
itself--now it is not needed... but will generate a linker error, since
it will not be on your system...

Warmest regards,
John

3684. Re: dipole center space?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-31 18:23:36 UTC
From: K7ITM <k7itm@aol.com>
Message-ID: <1117563816.087096.315050@g43g2000cwa.googlegroups.com>
Source record: 76149

It's the overall end-to-end length that matters most--along with elevation above ground and some other effects. If the center insulator is one of those ceramic "eggs" so the two wires form intertwined loops, you might end up with a couple pF extra capacitance, which is over 2000 ohms of capacitive reactance at 30MHz and even less effect at lower frequency. You're really unlikely to notice that in a dipole near half-wave resonance (low feedpoint impedance), though for full-wave resonance with small wire diameters (high feedpoint impedance) you _might_ be able to detect the effect. But if you're feeding with 450 ohm line, you presumably are using a tuner, and why on earth would you be worried about it?

Cheers,
Tom

You need to get lowev in freq. I can't just pop the MUF for any given
point in time, but for what you are talking about I would bet that 75,
80 meters would do it most of the time for you as long as it is darkish
of course! :-P

gud luck, 73,
Butch KF5DE

Joe:

In thinking about your question, it would surprise me if most any compiler and linker which will run on windows 2000 will not also run on windows xp--however, I am aware of no such COBOL compiler linker...

However, since the name of the language itself COBOL stands for "COmmon Business Orientated Language" it might be better to ask in a business-programming orientated newsgroup, rather than technical groups--just an idea...

Warmest regards,
John

>transmitter designed for 50 ohm loads.

Gentlemen, I know most of you are much more knowledgeable in some of
this, but with all your nit-picking over the impedances, etc., may I
interject that something is being overlooked?

The antenna feedline has some loss, however little, that may affect
the swr at the "source", which I interpret to be at the radio.

100 watts may be transmitted, 90 watts received at the antenna, 9
watts reflected, and 8.1 watts received back at the rig for reflected
power. My numbers are hypothetical, but you get the idea.

However, your discussions concerning SWR bridge impedance have led me
to wonder how accurate the swr meter in my rig is concerning the
antennas I use. I feed a dipole with 72 ohm into my rig, an IC-706
MKII which expects a 50 ohm load.

My attitude is that it must be ok if the rig sees it as low as it
should measure it as it sees it.

The HAARP and the NIF are even more dangerous than AIPAC which just
planted a few Mossad spies into the Pentagon and they sold the secrets
stolen to Israeli high tech and EM weapons national industries there.

Have you tried a raised antenna or are you talking on HTs?

I suspect that if you put up an outdoor vertical CB antenna at both
sites you should have no problems.

Let me reiterate, the Motorola white Teflon jacketed RG-58 type coax is slightly smaller in diameter than regular RG-58 coax, but not any more loss. Plus, the Teflon jacket is very slick, making pulling it in tight quarters easier. I'd still suggest you use the original coax as a pull line and pull up two of these Teflon jacketed coaxes.

3693. IC-706 on motorcycle; HF - CB interaction (damage to CB)?

Newsgroup: rec.radio.amateur.antenna
Date: 2005-05-31 21:52:10 UTC
From: "C. J. Clegg" <answer.to.newsgroup@nospam.com>
Message-ID: <7pmp91p6l8p4s689dbi0b9lavjotrgdcsi@4ax.com>
Source record: 76158

I have an IC-706 mounted on my Honda Gold Wing motorcycle. The motorcycle has a dealer-installed CB radio with the CB antenna mounted in back on the left side of the trunk. I have a 7-foot loaded vertical for 40 meters mounted to the rear crash bar, only about a foot to a foot and a half from the CB antenna.

My question is, if I transmit on 40 meters SSB at full power (nominally 100 watts, actually more like about 70 watts or so), am I likely to damage the front end of the CB radio? Will it matter if the CB radio is turned on or off?

I could crank the power on the IC-706 back to as little as 10 watts but it's going to be hard enough to raise any QSOs with the full 100 watts of power.

On the other hand, the motorcycle CB is big bucks to replace and I'd be just as happy not to damage it...

Thanks...

Hi Brett,

This is simply sheer and uninformed baloney.

>My coding directly relates to the VERY specific sliver of the industry I

Which means you lack the scope and depth to be making such absurd
generalizations you offer here.

>If you attempt to do that in real time, with very highly structured high
>level languages only, and only written with regards to structure in
>mind--you will ALWAYS fail

More unvarnished blarney. You already reveal that you have very
little production experience to the matter, and what you write,
following, reveals you had very little academic backing in formalisms
to boot.

>there is no processor fast enough, there is
>no affordable way to build a product platform to execute the code on....

There is a vast industry in "fast enough" processors that work quite
capably with structured code. They are called DSP chips and run at
the highest efficiencies on the most rigorous of structured code
derived from the academics of Fourier Analysis.

There are hundreds of millions of OTHER processors that are in the
market right now that operate nothing other than structured designs -
the manufacturers couldn't afford otherwise without being run out of
business from cut-throat competition. You wouldn't last a cache hit
in the Gaming market.

From the profound to the prosaic - I've built JAVA designed network
servers that processed the entire TCP/IP protocol stack that inhabited
the 8-bit realm of an 8051. All serving up the usual web pages with
illustrations galore in less than 1MB memory space on a circuit board
as large as your thumb. All for only $50 too. Any Cassandra calls
that fast processors are necessary are throwing instruction cycles
against the wall to see what argument will stick. The wall of
structure design is Teflon coated.

>In college you learn the rules and how to "do it right"--but this is
>only so in "real industry" you can effectively break these rules and end
>up making a profit--the fairies dance the pin...

Brett, you are barely a decade out of that shoe-box you call college
and it sounds like they gypped you of an education.

>Take a look at just the testing shell I began to translate the code
>given here to pascal--you will find it is indeed structured--that is
>because speed is of no real importance and I am only concerned about
>making it readable to others...

This is, in fact, a self incriminating testimony to the lack of your
testing in this regard, not proof of the slowness of structured
design. You offer no metrics whatever, and yet you are ready to
jettison proven techniques on the basis of speculation. This is
probably driven by indictments from other sources in the trade press
trying to drape themselves with the mantle of authority. Their Power
Point slide shows generally prove they don't know how to engineer
measurements they purport to offer. I've sat through to much of this
kind of hand waving from scads of one night wonders in engineering
management (back when the bubble was filling with clowns who could get
a job by simply nodding at other clowns with full wallets). It was
embarrassing to sit next to a customer who really knew better.

I've stood toe-to-toe with other development groups that practiced
your mantra and they proved to be bloated, inefficient and under
productive as they struggled to offer 1/3 the product my groups
churned out by practicing the hallmarks of good design.

We could pass on to the favorite whipping boy of "documentation."
This topic is one of those steps that is jettisoned first by these
managers-in-a-bubble as being frosting that comes last; and as long as
it has plenty of sugar, then no one will notice how little food value
there is in it. I've seen their mal nourished groups grind into the
late night, thrashing in confusion, missing deadlines, budgets going
bust, and projects being canceled. The favorite excuse is it was
someone else's fault, or if they are so egalitarian, it was out of
their control.

All such failure was easily foreseen in the loss of structure, one
bit misplaced has no resilience as would be tolerated in an analog
design; hence the denial of structure is a call for assisted suicide.

>It's the overall end-to-end length that matters most

Hi Tom,

Well, I guess it needed to be said.

What is missing here, that is about this insulator business, is that (if it isn't already obvious) there is wire coming from the transmission line that has been split out to make the connections at this insulator. This wire, too - as short as it may be, is transmitting as much (or as little) as ANY similar length of ANY section of the purported antenna.

To put it in another perspective (grossly exaggerated for the purpose of illustration, mind you); let's take a power line insulator that is three feet long. Now, does anyone imagine that this antenna is shorter than another antenna by that same three feet simply because the end-to-end length of both is the same? Perhaps if you haven't connected your transmission line to it to drive it - but then what purpose is your antenna?

As Reg might offer, I am merely "stating the bleeding obvious."

Sheer hogwash. You don't have enough experience in the matter.

>... to be both teacher and effective in industry--you must know both...

Brett,

Having been both, and having had my feet held to the fire to PROVE
accomplishment (not merely declare that those students who fell by the
way were unwashed or otherwise tainted); then your test between us is
one that you have failed to graduate from.

Your improvisation into the weak defense of metaphor is quickly
dismissed by fillip: "You only have experience with the edge of the
two sides of a coin."

I was an instructor in Electronics in the Navy. The Navy had a very
rigorous (read structured) system whereby the students proved the
merit of the instructor in the quality of their grades. All testing
was done through question banks that had a track record of thousands
of students having answered them and producing a grading curve. No
test was offered that did not offer the prospects of 90% of the class
achieving at least a grade of 80%. If that mark were missed anywhere,
then it was back to sea duty for the instructor. This was because to
his point of instruction, those students had pulled their weight and
proven their proficiency in a heavily formalized system geared to
produce America's best Electronics Technicians.

I've had more than 100,000 student-classroom hours of teaching
experience and my students advanced to higher realms of study
un-impeded by any lack of my skill. I worked from a syllabus that
mandated that I attend very specific and structured "learning goals"
by any method I thought fit. It took some very imaginative skill to
do that as my classes were populated by a variety of ethnicities and
foreign populations (Greeks, Brits, Turks, Iranians, Vietnamese,
Korean, to offer a few). Some students had only 6 weeks of English
language training. Yet, and all, they managed to pull their share of
the 80% grade expected of ME. Any grade higher was the merit of their
own accomplishments.

My commercial Engineering experience (more than triple your own
spanning many schools of thought on software design) encountered much
the same in the spread of ethnicity and population groups within my
teams (more Japanese, Chinese, and Indians these days). These groups
EXPECT structure, and any straying from that expectation is a flaccid
sign of weakness that they hold in contempt (which they have the grace
to not expose).

Hi C.J. With the antennas that close, you could cause damage to the
cb rig. You should have the cb turned off when transmitting with the
ham rig, you will overload the front end and get garbage out of the
speaker.
Some cb rigs ground the antenna with the rig off, and if yours does
then you are OK as long as the cb is off. If your rig does not do this
then you need to add a switch or relay to ground the antenna when the
cb is off, or you are transmitting with the ham rig. As you stated,
you will need all the power you can get to have QSOs, but at what point
does this damage the cb, too many variables?

Richard:

As you will have it... apparently the corp you work for has different
methods...

Warmest regards,
Brett Smith <grin>

I will try one more time, if you think we internship young minds because
they are getting all the education they need at mit or berkeley--you are
mistaken, we internship them to "turn them to the dark side", we feed
'em goto-burgers and spaghetti-code (well, something like that)...
